# ALMOST EVERYWHERE CONVERGENCE OF CONE-LIKE RESTRICTED DOUBLE FEJÉR MEANS ON COMPACT TOTALLY DISCONNECTED GROUPS 

KÁROLY NAGY<br>Dedicated to the memory of Professor Árpád Varecza on the occasion of his 70th birthday.

#### Abstract

In the present paper we prove the a.e. convergence of Fejér means of integrable functions with respect to the two-dimensional representative product systems on a bounded compact totally disconnected group provided that the set of indices is in a cone-like set.

## 1. Introduction

Now, we give a brief introduction, for more details see [3]. Moreover, see the book of Hewitt and Ross [9] and Schipp, Wade, Simon and Pál [11].

Denote by $\mathbb{N}, \mathbb{P}$ the set of natural numbers and the set of positive integers, respectively. Let $m:=\left(m_{k}, k \in \mathbb{N}\right)$ be a sequence of positive integers such that $m_{k} \geq 2$ and $G_{k}$ a finite group with order $m_{k},(k \in \mathbb{N})$. Suppose that each group has discrete topology and normalized Haar measure $\mu_{k}$. Let $G_{m}$ be the compact group formed by the complete direct product of the groups $G_{k}$ with the product of the topologies, operations and measures ( $\mu$ ). Thus, each $x \in G_{m}$ is a sequence $x:=\left(x_{0}, x_{1}, \ldots\right)$, where $x_{k} \in G_{k},(k \in \mathbb{N})$. We call this sequence the expansion of $x$. The compact totally disconnected (simply CTD) group $G_{m}$ is called a bounded group if the sequence $m$ is bounded. All over this paper the boundedness of the group $G_{m}$ is supposed. Set $m_{*}:=\max \left\{m_{k}: k \in \mathbb{N}\right\}$. A neighborhood base of the topology can be given in the following way:

$$
I_{0}(x):=G_{m} \quad I_{n}(x):=\left\{y \in G_{m}: y_{k}=x_{k} \text { for } 0 \leq k<n\right\},
$$

where $x \in G_{m}, n \in \mathbb{P}$. Let $M_{0}:=1$ and $M_{k+1}:=m_{k} M_{k}, k \in \mathbb{N}$, every $n \in \mathbb{N}$ can be uniquely expressed as $n=\sum_{k=0}^{\infty} n_{k} M_{k}, 0 \leq n_{k}<m_{k}, n_{k} \in \mathbb{N}$. This allows us to say that the sequence $\left(n_{0}, n_{1}, \ldots\right)$ is the expansion of $n$ with respect to the number system $m$. We often use the following notations:

[^0]$|n|:=\max \left\{k \in \mathbb{N}: n_{k} \neq 0\right\}, n_{(k)}:=\sum_{j=0}^{k-1} n_{k} M_{k}$, and $n^{(k)}:=\sum_{k}^{\infty} n_{k} M_{k}$, where $|n|$ is called the order of $n$.

Denote by $\Sigma_{k}$ the dual object of the finite group $G_{k}(k \in \mathbb{N})$. Thus, each $\sigma \in \Sigma_{k}$ is a set of continuous irreducible unitary representations of $G_{k}$ which are equivalent to some fixed representation $U^{(\sigma)}$. Let $d_{\sigma}$ be the dimension of its representation space and let $\left\{\xi_{1}, \xi_{2}, \ldots, \xi_{d_{\sigma}}\right\}$ be a fixed, but arbitrary orthonormal basis in the representation space. The functions $u_{i, j}^{(\sigma)}(x):=\left\langle U_{x}^{(\sigma)} \xi_{i}, \xi_{j}\right\rangle$ $\left(i, j \in\left\{1, \ldots, d_{\sigma}\right\}, x \in G_{k}\right)$ are called the coordinate functions for $U^{(\sigma)}$ and the basis $\left\{\xi_{1}, \xi_{2}, \ldots, \xi_{d_{\sigma}}\right\}$. Let $\left\{\varphi_{k}^{s}: 0 \leq s<m_{k}\right\}$ be a system of all normalized coordinate functions of the group $G_{k}$. We suppose that $\varphi_{k}^{0} \equiv 1$. Thus, for every $0 \leq s<m_{k}$ there exists a $\sigma \in \Sigma_{k}, i, j \in\left\{1, \ldots, d_{\sigma}\right\}$ such that $\varphi_{s}(x)=\sqrt{d_{\sigma}} u_{i, j}^{(\sigma)}(x)$ for $x \in G_{k}$. Let $\psi$ be the product system of the functions $\varphi_{k}^{s}$, that is

$$
\psi_{n}(x):=\prod_{k=0}^{\infty} \varphi_{k}^{n_{k}}\left(x_{k}\right) \quad\left(x \in G_{m}\right)
$$

where $n$ is of the form $n=\sum_{k=0}^{\infty} n_{k} M_{k}$ and $x=\left(x_{0}, x_{1}, \ldots\right)$. The system $\psi$ is orthonormal and complete on $L^{2}\left(G_{m}\right)$ [7]. If the group $G_{k}$ is the discrete cyclic group of order $m_{k}$ for each $k \in \mathbb{N}$, then the system $\psi$ is the well-known Vilenkin system and $G_{m}$ is a Vilenkin group[1]. As special cases we have the Walsh system and the Walsh group, too [11]. The system $\psi$ is called representative product system of the CTD group.

Let us consider the Dirichlet and Fejér kernel functions

$$
D_{n}(y, x):=\sum_{k=0}^{n-1} \psi_{k}(y) \overline{\psi_{k}}(x), \quad K_{n}(y, x):=\frac{1}{n} \sum_{k=1}^{n} D_{k}(y, x)
$$

and $D_{0}=K_{0}:=0$. The $M_{n}$ th Dirichlet kernel has got a closed form [7]

$$
D_{M_{n}}(y, x)= \begin{cases}M_{n}, & \text { for } y \in I_{n}(x) \\ 0, & \text { otherwise }\end{cases}
$$

Recently, the behavior of the Dirichlet kernel was discussed by Toledo [14, 12]. The Fourier coefficients, the partial sums of Fourier series and the Fejér means are defined in the usual way for $f \in L^{1}\left(G_{m}\right)$. It is known that

$$
\sigma_{n} f(y)=\int_{G_{m}} f(x) K_{n}(y, x) d \mu(x) .
$$

Denote $G_{m} \times G_{\tilde{m}}$ the two-dimensional compact totally disconnected (CTD) group. Define the two-dimensional Dirichlet and Fejér kernel functions as the Kronecker product of the one-dimensional functions

$$
D_{n}(y, x):=D_{n_{1}}\left(y^{1}, x^{1}\right) D_{n_{2}}\left(y^{2}, x^{2}\right), \quad K_{n}(y, x):=K_{n_{1}}\left(y^{1}, x^{1}\right) K_{n_{2}}\left(y^{2}, x^{2}\right),
$$

where $y:=\left(y^{1}, y^{2}\right), x:=\left(x^{1}, x^{2}\right) \in G_{m} \times G_{\tilde{m}}$ and $n=\left(n_{1}, n_{2}\right) \in \mathbb{N}^{2}$. The following is well-known

$$
\sigma_{n} f(y)=\int_{G_{m} \times G_{\tilde{m}}} f\left(u^{1}, u^{2}\right) K_{n_{1}}\left(y^{1}, u^{1}\right) K_{n_{2}}\left(y^{2}, u^{2}\right) d \mu\left(u^{1}, u^{2}\right)
$$

In the present paper we also suppose that $m=\tilde{m}$ and we write simply $G_{m}^{2}=$ $G_{m} \times G_{\tilde{m}}$, although we know that $G_{m} \neq G_{\tilde{m}}$ may be happened. During the proofs $C$ and $c$ denote constants which may depend only on $m_{*}$ and could vary at different occurrences.

In [7] Gát and Toledo proved the fact that the Fejér means of the Fourier series with respect to representative product systems on bounded groups converge to the function in $L^{p}$-norm $(1 \leq p<\infty)$, although we can not state the same for the Fourier series in general. In 2009 they extended this statement to Cesàro means of order $\alpha$ where $0<\alpha<1$ [8]. On the other hand the behavior of the partial sums worse than in the commutative (Vilenkin, Walsh) case. Let $G_{m}$ be the complete product of $\mathcal{S}_{3}$. If $1<p<\infty$ and $p \neq 2$, then there exists an $f \in L^{p}\left(G_{m}\right)$ such that $S_{n} f$ does not converge to the function $f$ in $L^{p}$-norm [13].

The almost everywhere convergence of the one-dimensional Fejér means was proved by Gát in [3]. Our paper deal with the a.e. convergence of the twodimensional Fejér means provided that the set of indices is in a cone-like set. We note that until the present time there was not any result given in dimension 2 for the Fourier series on CTD groups.

For double Walsh-Fourier series, Móricz, Schipp and Wade [10] proved that $\sigma_{n} f$ converge to $f$ a.e. in the Pringsheim sense (that is, no restriction on the indices other than $\min \left(n_{1}, n_{2}\right) \rightarrow \infty$ ) for all functions $f \in L \log ^{+} L$. For double Walsh system Gát [4] and Weisz [15] proved that the Fejér means of an integrable function converge almost everywhere to the function itself provided that the indices satisfy the inequality $\beta^{-1} \leq n_{1} / n_{2} \leq \beta$ with some fixed $\beta>1$. Recently, a common generalization of the results of Gát, Weisz and the result of Móricz, Schipp, Wade (with respect to Walsh system) was given in the same direction and way as Gát did in [5] with respect to the trigonometric system. A necessary and sufficient condition for cone-like sets was given by the author and Gát in order to preserve the convergence property for Walsh system [6].

In the present paper we prove the a.e. convergence of Fejér means of integrable functions with respect to two-dimensional representative product systems of a bounded CTD group provided that the set of indices is in a cone-like set.
2. Almost everywhere convergence of double Fejér means with CONE RESRICTION

The following Lemmas are the basis of our proof:

Lemma 2.1 (Gát [3]). Let $A, t, s, n \in \mathbb{N}$, and $x \in I_{t+1}(u), u \in G_{m}$. Then

$$
\int_{I_{t}(u) \backslash I_{t+1}(u)} \sup _{M_{A} \leq n^{(s)}<M_{A+1}}\left|K_{n^{(s)}, M_{s}}(y, x)\right| d \mu(y) \leq c M_{\min (s, t)} \sqrt{\frac{M_{A}}{M_{\max (s, t)}}} .
$$

Lemma 2.2. Let $A, t \in \mathbb{N}$, and $x \in I_{t+1}(u), u \in G_{m}$. Then

$$
\int_{I_{t}(u) \backslash I_{t+1}(u)} \sup _{n \geq M_{A}}\left|K_{n}(y, x)\right| d \mu(y) \leq c \sqrt{\frac{M_{t}}{M_{A}}} .
$$

Proof. Set $x \in I_{t+1}(u), u \in G_{m}$. By Lemma 2.1 and the method of Gát we write that

$$
\begin{aligned}
& \int_{I_{t}(u) \backslash I_{t+1}(u)} \sup _{n \geq M_{A}}\left|K_{n}(y, x)\right| d \mu(y) \leq \sum_{B=A}^{\infty} \int_{I_{t}(u) \backslash I_{t+1}(u)} \sup _{|n|=B}\left|K_{n}(y, x)\right| d \mu(y) \\
& \quad \leq \sum_{B=A}^{\infty} \frac{1}{M_{B}} \int_{I_{t}(u) \backslash I_{t+1}(u)} \sup _{|n|=B} \sum_{s=0}^{B} \sum_{j=0}^{m_{s}-2}\left|K_{n^{(s+1)}+j M_{s}, M_{s}}(y, x)\right| d \mu(y) \\
& \quad \leq \sum_{B=A}^{\infty} \frac{1}{M_{B}} \sum_{s=0}^{B} \int_{I_{t}(u) \backslash I_{t+1}(u)|n|=B} \sup _{|n|}\left|K_{n^{(s)}, M_{s}}(y, x)\right| d \mu(y) \\
& \quad \leq c \sum_{B=A}^{\infty} \frac{1}{M_{B}}\left(\sum_{s=0}^{t} M_{s} \sqrt{\frac{M_{B}}{M_{t}}}+\sum_{s=t+1}^{B} M_{t} \sqrt{\frac{M_{B}}{M_{s}}}\right) \\
& \quad \leq c \sum_{B=A}^{\infty} \frac{1}{M_{B}} M_{t} \sqrt{\frac{M_{B}}{M_{t}}} \leq c \sqrt{\frac{M_{t}}{M_{A}}}
\end{aligned}
$$

We define the maximal operator $\sigma^{\#}$ by

$$
\sigma^{\#} f:=\sup _{\substack{n \in \mathbb{P}^{2} \\ \beta^{-1} \leq n_{1} / n_{2} \leq \beta}}\left|\sigma_{n} f\right|,
$$

where $\beta>1$ is a fixed parameter. For this maximal operator we have the following theorem:

Theorem 2.3. The operator $\sigma^{\#}$ is of weak type $(1,1)$.
By standard argument we get that
Theorem 2.4. Let $f \in L^{1}\left(G_{m}^{2}\right)$ and $\beta \geq 1$ be a fixed parameter. Then the relation

$$
\lim _{\substack{\wedge n \rightarrow \infty \\ \beta^{-1} \leq n_{1} / n_{2} \leq \beta}} \sigma_{n} f=f \quad \text { a.e. }
$$

holds.
By the help of Lemma 2.2, the well-known Calderon-Zygmund decomposition Lemma and the method of Gát and Blahota in [2] (with necessary changes)
we have the proof of Theorem 2.3. On the other hand, Theorem 2.3 could be reach as a corollary of our main theorem in the following section.

At last, we note that Theorem 2.4 is unknown until the present time.

## 3. Pointwise convergence of cone-Like restricted two-dimensional Fejér means

Now, we define the cone-like sets. Let $\alpha:[1,+\infty) \rightarrow[1,+\infty)$ be a strictly monotone increasing continuous function with property $\lim _{+\infty} \alpha=+\infty, \alpha(1)=$ 1 , and $\beta:[1,+\infty) \rightarrow[1,+\infty)$ be a monotone increasing function with property $\beta(1)>1$.

Define the cone-like restriction sets of $\mathbb{N}^{2}$ as follows [5, 6]:

$$
\begin{aligned}
& \mathbb{N}_{\alpha, \beta, 1}:=\left\{n \in \mathbb{N}^{2}: \frac{\alpha\left(n_{1}\right)}{\beta\left(n_{1}\right)} \leq n_{2} \leq \alpha\left(n_{1}\right) \beta\left(n_{1}\right)\right\} \\
& \mathbb{N}_{\alpha, \beta, 2}:=\left\{n \in \mathbb{N}^{2}: \frac{\alpha^{-1}\left(n_{2}\right)}{\beta\left(n_{2}\right)} \leq n_{1} \leq \alpha^{-1}\left(n_{2}\right) \beta\left(n_{2}\right)\right\}
\end{aligned}
$$

For $\alpha(x):=x, \beta(x):=\beta(\beta \in(1, \infty))$ we get the restriction set $\mathbb{N}_{\alpha, \beta, 1}=$ $\mathbb{N}_{\alpha, \beta, 2}=\left\{n \in \mathbb{N}^{2}: \frac{1}{\beta} \leq \frac{n_{2}}{n_{1}} \leq \beta\right\}$ used in [2, 4, 15].

Let $\beta(x)=\beta$ be a constant function. It is natural that $\mathbb{N}_{\alpha, \beta_{1}, 1} \subset \mathbb{N}_{\alpha, \beta_{2}, 1}$ and $\mathbb{N}_{\alpha, \beta_{1}, 2} \subset \mathbb{N}_{\alpha, \beta_{2}, 2}$ for any $\beta_{1} \leq \beta_{2}$.

For $i=1,2$ set

$$
\mathbb{N}_{\alpha, i}:=\left\{\mathbb{N}_{\alpha, \beta, i}: \beta>1\right\}
$$

For a fixed $i \in\{1,2\}$, we say that $\mathbb{N}_{\alpha, i}$ is weaker than $\mathbb{N}_{\alpha, 3-i}$, if for all $L \in$ $\mathbb{N}_{\alpha, i}$, there exists an $\tilde{L} \in \mathbb{N}_{\alpha, 3-i}$ such that $L \subset \tilde{L}$. This will be denoted by $\mathbb{N}_{\alpha, i} \prec \mathbb{N}_{\alpha, 3-i}$. If $\mathbb{N}_{\alpha, 1} \prec \mathbb{N}_{\alpha, 2}$ and $\mathbb{N}_{\alpha, 2} \prec \mathbb{N}_{\alpha, 1}$, then we say that $\mathbb{N}_{\alpha, 1}$ and $\mathbb{N}_{\alpha, 2}$ are equivalent and denote this by $\mathbb{N}_{\alpha, 1} \sim \mathbb{N}_{\alpha, 2}$.

We say that the function $\alpha$ is a cone-like restriction function (CRF), if $\mathbb{N}_{\alpha, 1} \sim \mathbb{N}_{\alpha, 2}$. Set $\mathbb{N}_{\alpha}:=\mathbb{N}_{\alpha, 1} \cup \mathbb{N}_{\alpha, 2}$. We say that the cone-like set $L \in \mathbb{N}_{\alpha}$ is based on the function $\alpha$.

The properties of a CRF is characterized in the following statement [5]: Function $\alpha$ is a CRF if and only if there exist $\zeta, \gamma_{1}, \gamma_{2}>1$ such that the inequality

$$
\begin{equation*}
\gamma_{1} \alpha(x) \leq \alpha(\zeta x) \leq \gamma_{2} \alpha(x) \tag{3.1}
\end{equation*}
$$

holds for each $x \geq 1$.
In other words, the condition $\gamma_{1} \alpha(x) \leq \alpha(\zeta x) \leq \gamma_{2} \alpha(x)$ is very natural, since it is necessary and sufficient in order to have that for all restriction set $L \in \mathbb{N}_{\alpha, 1}$ there exists a restriction set $\tilde{L} \in \mathbb{N}_{\alpha, 2}$ such that $L \subset \tilde{L}$, and in the same way backwards also.

We define the maximal operator $\sigma_{L}^{*}$ by

$$
\sigma_{L}^{*}:=\sup _{n \in L}\left|\sigma_{n} f\right| .
$$

For the maximal operator $\sigma_{L}^{*}$ we prove the following theorem:
Theorem 3.1. Let $\alpha$ be $C R F, L \in \mathbb{N}_{\alpha}$. Then the operator $\sigma_{L}^{*}$ is of weak type $(1,1)$.

By standard argument we get that
Theorem 3.2. Let $\alpha$ be $C R F, L \in \mathbb{N}_{\alpha}$. Then for any $f \in L^{1}\left(G_{m}^{2}\right)$ the relation

$$
\lim _{\substack{\wedge n \rightarrow \infty \\ n \in L}} \sigma_{n} f=f \quad \text { a.e. }
$$

holds.
We immediately have Theorem 2.4 in the previous section as a corollary. To prove Theorem 3.1 we need the following decomposition Lemma of Calderon and Zygmund type proved in [5].

Lemma 3.3. Let the function $\varphi_{j}:[1,+\infty) \rightarrow[1,+\infty)$ be monotone increasing and continuous with property $\lim _{+\infty} \varphi_{j}=+\infty(j=1,2)$. Set $\phi_{j}:=\left\lfloor\varphi_{j}\right\rfloor$ $(j=1,2)$ (where $\lfloor x\rfloor$ denotes the lower integer part of $x$ ).

Let $f \in L^{1}$ and $\lambda>\|f\|_{1}$. Then there exists a sequence of integrable functions $\left(f_{i}\right)$ such that

$$
f=\sum_{i=0}^{\infty} f_{i},
$$

where $\left\|f_{0}\right\|_{\infty} \leq C \lambda,\left\|f_{0}\right\|_{1} \leq C\|f\|_{1}$ and $\operatorname{supp} f_{i} \subset I_{k^{i, 1}}\left(x_{1}^{i}\right) \times I_{k^{i, 2}}\left(x_{2}^{i}\right)=: J_{1}^{i} \times J_{2}^{i}$ $\left(\left(x_{1}^{i}, x_{2}^{i}\right) \in G_{m}^{2}\right)$ with measures

$$
\mu\left(I_{k^{i}, 1}\left(x_{1}^{i}\right)\right)=1 / M_{\phi_{1}\left(s_{i}\right)} \text { and } \mu\left(I_{k^{i}, 2}\left(x_{2}^{i}\right)\right)=1 / M_{\phi_{2}\left(s_{i}\right)}
$$

for some $s_{i} \geq 1$. Moreover, $\int_{G_{m}^{2}} f_{i}=0(i \geq 1)$, the sets $J_{1}^{i} \times J_{2}^{i}$ are disjoint, and with the definition $F:=\bigcup_{i=1}^{\infty}\left(I_{k^{i, 1}}\left(x_{1}^{i}\right) \times I_{k^{i, 2}}\left(x_{2}^{i}\right)\right)$ we have $\mu(F) \leq C\|f\|_{1} / \lambda$.

Proof of Theorem 3: During the proof of Theorem 3.1 we follow the method of the author and Gát in [6]. But, we have to make necessary changes, because we have got another structure than in the Walsh case.

Let $L \in \mathbb{N}_{\alpha}$. Without loss of generality, we suppose that $L=\mathbb{N}_{\alpha, \beta, 1}$ for some $\beta>1$. First, we choose functions $\phi_{1}(s):=|s|$ (that is, $\phi_{1}(s)$ is the order of $s$ and $M_{|s|} \leq s<M_{|s|+1}$ ) and $\phi_{2}(s):=|\alpha(s)|$, where $\alpha$ is CRF (we note that the continuous functions $\varphi_{1}, \varphi_{2}$ can be constructed). We apply Lemma 3.3 for the functions $\phi_{1}(s), \phi_{2}(s)$.

Set $f \in L^{1}\left(G_{m}^{2}\right)$ and $\operatorname{supp} f \subset J_{1} \times J_{2}$ with measure $\mu\left(J_{i}\right)=\frac{1}{M_{\phi_{i}(s)}}$ for some $s \geq 1(i=1,2)$. Set $k^{j}:=\phi_{j}(s)$, that is $J_{i}=I_{k^{i}}\left(x^{i}\right)$ for $j=1,2$.

By the help of Lemma 2.2 we prove the inequality

$$
\begin{equation*}
\int_{\overline{I_{k^{1}}\left(x^{1}\right) \times I_{k^{2}}\left(x^{2}\right)}} \sup _{n \in L}\left|\sigma_{n} f\right| \leq c\|f\|_{1} . \tag{3.2}
\end{equation*}
$$

We decompose the set $\overline{I_{k^{1}}\left(x^{1}\right) \times I_{k^{2}}\left(x^{2}\right)}$ as the following union:

$$
\left(\overline{I_{k^{1}}\left(x^{1}\right)} \times \overline{I_{k^{2}}\left(x^{2}\right)}\right) \cup\left(I_{k^{1}}\left(x^{1}\right) \times \overline{I_{k^{2}}\left(x^{2}\right)}\right) \cup\left(\overline{I_{k^{1}}\left(x^{1}\right)} \times I_{k^{2}}\left(x^{2}\right)\right) .
$$

We set $\delta:=\zeta^{\log _{\gamma_{1}}\left(2 \beta m_{*}\right)+1} . n_{1} \leq M_{\phi_{1}(s)} / \delta$ yields that

$$
\begin{aligned}
n_{2} & \leq \beta \alpha\left(n_{1}\right) \leq \beta \alpha\left(M_{\phi_{1}(s)} \zeta^{-\log _{\gamma_{1}}\left(2 \beta m_{*}\right)-1}\right) \\
& \leq \beta \frac{1}{\gamma_{1}^{\log _{\gamma_{1}} 2 \beta m_{*}+1}} \alpha\left(M_{\phi_{1}(s)}\right) \leq \frac{\alpha(s)}{2 m_{*}}<M_{\phi_{2}(s) .} .
\end{aligned}
$$

Moreover, $\zeta, \gamma_{1}, \gamma_{2}>1$ gives $n_{1}<M_{k^{1}}$ and $n_{2}<M_{k^{2}}$. In this case the $(k, l)$-th Fourier coefficients are zeros for $k \leq n_{1}$ and $l \leq n_{2}$. More exactly,

$$
\hat{f}(k, l)=\int_{G_{m}^{2}}^{f}\left(\bar{\psi}_{k} \times \bar{\psi}_{l}\right)=\int_{I_{k^{1}}\left(x^{1}\right) \times I_{k^{2}}\left(x^{2}\right)} f\left(\bar{\psi}_{k} \times \bar{\psi}_{l}\right)=\left(\bar{\psi}_{k} \times \bar{\psi}_{l}\right) \int_{I_{k^{1}}\left(x^{1}\right) \times I_{k^{2}}\left(x^{2}\right)} \quad f=0 .
$$

This yields that $\sigma_{n} f=0$. That is, we have to suppose that $n_{1}>M_{\phi_{1}(s)} / \delta \geq$ $M_{k^{1}-c_{*}}$. From this we write that

$$
\begin{aligned}
n_{2} \geq \frac{\alpha\left(n_{1}\right)}{\beta} & \geq \frac{\alpha\left(M_{\phi_{1}(s)} m_{*} / \delta m_{*}\right)}{\beta} \geq \frac{1}{\beta \gamma_{2}^{\log _{\zeta} m_{*}+\log _{\gamma_{1}} 2 \beta m_{*}+1}} \alpha\left(M_{\phi_{1}(s)} m_{*}\right) \\
& \geq \frac{\alpha(s)}{\delta^{\prime}} \geq \frac{M_{\phi_{2}}(s)}{\delta^{\prime}} \geq M_{k^{2}-c^{*}} .
\end{aligned}
$$

Now, we discuss the integral $\int_{\overline{I_{k^{1}}\left(x^{1}\right)} \times \overline{I_{k^{2}}\left(x^{2}\right)}} \sup _{n \in L}\left|\sigma_{n} f\right|$.
Now, we decompose the sets $\overline{\bar{k}_{k^{i}}\left(x^{i}\right)}(i=1,2)$ in the usual way. Using the notation

$$
J^{a, b}:=\left(I_{a}\left(x^{1}\right) \backslash I_{a+1}\left(x^{1}\right)\right) \times\left(I_{b}\left(x^{2}\right) \backslash I_{b+1}\left(x^{2}\right)\right)
$$

for $a=0,1, \ldots, k^{1}-1, b=0,1, \ldots, k^{2}-1$ we have that

$$
\overline{I_{k^{1}}\left(x^{1}\right)} \times \overline{I_{k^{2}}\left(x^{2}\right)}=\bigcup_{a=0}^{k^{1}-1} \bigcup_{b=0}^{k^{2}-1} J^{a, b} .
$$

By Lemma 2.2 (with $u^{1} \in I_{k^{1}}\left(x^{1}\right)=J^{1}$ ) and theorem of Fubini we get that

$$
\begin{aligned}
& \int_{J^{a, b}} \sup _{n \in L}\left|\int_{J^{1} \times J^{2}} f\left(u^{1}, u^{2}\right) K_{n_{1}}\left(y^{1}, u^{1}\right) K_{n_{2}}\left(y^{2}, u^{2}\right) d \mu\left(u^{1}, u^{2}\right)\right| d \mu\left(y^{1}, y^{2}\right) \\
& \quad \leq \int_{J^{1} \times J^{2}}\left|f\left(u^{1}, u^{2}\right)\right| \int_{J^{a, b}} \sup _{n \in L}\left|K_{n_{1}}\left(y^{1}, u^{1}\right) K_{n_{2}}\left(y^{2}, u^{2}\right)\right| d \mu\left(y^{1}, y^{2}\right) d \mu\left(u^{1}, u^{2}\right) \\
& \quad \leq \int_{J^{1} \times J^{2}}\left|f\left(u^{1}, u^{2}\right)\right| \int_{J^{a, b}} \sup _{n_{1} \geq M_{k^{1}-c *}}\left|K_{n_{1}}\left(y^{1}, u^{1}\right)\right| \times \\
& \quad \times \sup _{n_{2} \geq M_{k^{2}-c^{*}}}\left|K_{n_{2}}\left(y^{2}, u^{2}\right)\right| d \mu\left(y^{1}, y^{2}\right) d \mu\left(u^{1}, u^{2}\right) \\
& \quad \leq c\|f\|_{1} \sqrt{\frac{M_{a} M_{b}}{M_{k^{1}} M_{k^{2}}}}
\end{aligned}
$$

Moreover, we write that

$$
\begin{aligned}
\int_{\overline{I_{k^{1}}\left(x^{1}\right)} \times \overline{I_{k^{2}}\left(x^{2}\right)}} \sup _{n \in L}\left|\sigma_{n} f\right| \leq \sum_{a=0}^{k^{1}-1} \sum_{b=0}^{k^{2}-1} & \int_{J^{a, b}} \sup _{n \in L}\left|\sigma_{n} f\right| \\
& \leq c\|f\|_{1} \sum_{a=0}^{k^{1}-1} \sum_{b=0}^{k^{2}-1} \sqrt{\frac{M_{a} M_{b}}{M_{k^{1}} M_{k^{2}}}} \leq c\|f\|_{1} .
\end{aligned}
$$

We discuss the integral $\int_{I_{k^{1}}\left(x^{1}\right) \times \overline{I_{k}{ }^{2}\left(x^{2}\right)}} \sup _{n \in L}\left|\sigma_{n} f\right|$.
For $r \geq k^{1}$ and a fixed $x^{1} \in G_{m}$ we set an $\epsilon:=\left(x_{0}^{1}, \ldots, x_{k^{1}-1}^{1}, \epsilon_{k^{1}}, \ldots, \epsilon_{r}, x_{r+1}^{1}, \ldots\right)$, where $\epsilon_{i} \in G_{i}\left(i=k^{1}, \ldots, r\right)$.

Then

$$
I_{k^{1}}\left(x^{1}\right)=\bigcup_{\substack{\epsilon_{i} \in G_{i} \\ i=k^{1}, \ldots, r}} I_{r+1}(\epsilon)
$$

For each $a=k^{1}, \ldots, r, b=0,1, \ldots, k^{2}-1$ and an arbitrary $\epsilon$ we define the sets $J_{\epsilon}^{a, b}$ and $J_{\epsilon}^{b}$ by

$$
J_{\epsilon}^{a, b}:=\left(I_{a}(\epsilon) \backslash I_{a+1}(\epsilon)\right) \times\left(I_{b}\left(x^{2}\right) \backslash I_{b+1}\left(x^{2}\right)\right)
$$

and

$$
J_{\epsilon}^{b}:=I_{r+1}(\epsilon) \times\left(I_{b}\left(x^{2}\right) \backslash I_{b+1}\left(x^{2}\right)\right)
$$

Then we have the following disjoint decomposition of the set $I_{k^{1}}\left(x^{1}\right) \times \overline{I_{k^{2}}\left(x^{2}\right)}$ :

$$
I_{k^{1}}\left(x^{1}\right) \times \overline{I_{k^{2}}\left(x^{2}\right)}=\left(\bigcup_{a=k^{1}}^{r} \bigcup_{b=0}^{k^{2}-1} J_{\epsilon}^{a, b}\right) \bigcup\left(\bigcup_{b=0}^{k^{2}-1} J_{\epsilon}^{b}\right) .
$$

We introduce the following abbreviation:

$$
S_{r}^{L}:=\sup _{\substack{M_{r-c} \leq n_{1} \leq M_{r+c} \\ n \in L}}
$$

It is easy to see that, $c \alpha\left(M_{r}\right) \leq n_{2} \leq C \alpha\left(M_{r}\right)$ for $n \in L$ and $M_{r} \leq n_{1} \leq c M_{r}$. Theorem of Fubini and the decomposition given above yields that

$$
\begin{aligned}
& \int_{I_{k^{1}}\left(x^{1}\right) \times \overline{I_{k^{2}}\left(x^{2}\right)}} \sup _{n \in L}\left|\sigma_{n} f\left(y^{1}, y^{2}\right)\right| d \mu\left(y^{1}, y^{2}\right) \leq \\
& \leq \sum_{r=k^{1}}^{\infty} \int_{I_{k^{1}}\left(x^{1}\right) \times \overline{I_{k^{2}}\left(x^{2}\right)}} S_{r}^{L}\left|\int_{I_{k^{1}}\left(x^{1}\right) \times I_{k^{2}}\left(x^{2}\right)}^{f\left(u^{1}, u^{2}\right) K_{n_{1}}}\left(y^{1}, u^{1}\right) K_{n_{2}}\left(y^{2}, u^{2}\right) d \mu\left(u^{1}, u^{2}\right)\right| d \mu\left(y^{1}, y^{2}\right) \\
& \left.\leq \sum_{r=k^{1}}^{\infty} \sum_{\epsilon} \int_{I_{k^{1}}\left(x^{1}\right) \times \frac{I_{k^{2}}\left(x^{2}\right)}{}} \frac{S_{2}^{L}}{} \int_{I_{r+1}(\epsilon) \times I_{k}{ }^{2}\left(x^{2}\right)}^{f\left(u^{1}, u^{2}\right) K_{n_{1}}}\left(y^{1}, u^{1}\right) K_{n_{2}}\left(y^{2}, u^{2}\right) d \mu\left(u^{1}, u^{2}\right) \right\rvert\, d \mu\left(y^{1}, y^{2}\right) \\
& \leq \sum_{r=k^{1}}^{\infty} \sum_{\epsilon} \sum_{a=k^{1}}^{r} \sum_{b=0}^{k^{2}-1} \int_{J_{\epsilon}, b}^{S_{r^{, b}}^{L}} \int_{I_{r+1}(\epsilon) \times I_{k^{2}}\left(x^{2}\right)} f\left(u^{1}, u^{2}\right) K_{n_{1}}\left(y^{1}, u^{1}\right) K_{n_{2}}\left(y^{2}, u^{2}\right) d \mu\left(u^{1}, u^{2}\right) \mid d \mu\left(y^{1}, y^{2}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \leq \sum_{r=k^{1}}^{\infty} \sum_{\epsilon} \sum_{a=k^{1}}^{r} \sum_{b=0}^{k^{2}-1} \int_{I_{r+1}(\epsilon) \times I_{k^{2}}\left(x^{2}\right)}\left|f\left(u^{1}, u^{2}\right)\right| \int_{J_{e}^{a, b}} \sup _{M_{r-c} \leq n_{1}}\left|K_{n_{1}}\left(y^{1}, u^{1}\right)\right| \times \\
& \times \sup _{c \alpha\left(M_{r}\right) \leq n_{2}}\left|K_{n_{2}}\left(y^{2}, u^{2}\right)\right| d \mu\left(y^{1}, y^{2}\right) d \mu\left(u^{1}, u^{2}\right) \\
& +\sum_{r=k^{1}}^{\infty} \sum_{\epsilon} \sum_{b=0}^{k^{2}-1} \int_{I_{r+1}(\epsilon) \times I_{k^{2}}\left(x^{2}\right)}\left|f\left(u^{1}, u^{2}\right)\right| \int_{J_{\epsilon}^{b}} \sup _{n_{1} \leq M_{r+c}}\left|K_{n_{1}}\left(y^{1}, u^{1}\right)\right| \times \\
& \times \sup _{c \alpha\left(M_{r}\right) \leq n_{2}}\left|K_{n_{2}}\left(y^{2}, u^{2}\right)\right| d \mu\left(y^{1}, y^{2}\right) d \mu\left(u^{1}, u^{2}\right) \\
& =: I+I I \text {. }
\end{aligned}
$$

We discuss $I$. We use Lemma 2.2 and $u^{1} \in I_{r+1}(\epsilon), u^{2} \in I_{k^{2}}\left(x^{2}\right)$. Thus,

$$
I \leq c\|f\|_{1} \sum_{r=k^{1}}^{\infty} \sum_{a=k^{1}}^{r} \sum_{b=0}^{k^{2}-1} \sqrt{\frac{M_{a} M_{b}}{M_{r} \alpha\left(M_{r}\right)}} \leq c\|f\|_{1} \sum_{r=k^{1}}^{\infty} \sqrt{\frac{M_{k^{2}}}{\alpha\left(M_{r}\right)}} .
$$

From Lemma 2.2 (with $\left.u^{2} \in I_{k^{2}}\left(x^{2}\right)\right)$ and the fact that $\left|K_{n}\right| \leq c n$ (see [3]) we get that

$$
\begin{aligned}
I I & \leq c \sum_{r=k^{1}}^{\infty} \sum_{\epsilon} \sum_{b=0}^{k^{2}-1} \int_{I_{r+1}(\epsilon) \times I_{k^{2}}\left(x^{2}\right)}\left|f\left(u^{1}, u^{2}\right)\right| M_{r} \frac{1}{M_{r}} \sqrt{\frac{M_{b}}{\alpha\left(M_{r}\right)}} d \mu\left(u^{1}, u^{2}\right) \\
& \leq c\|f\|_{1} \sum_{r=k^{1}}^{\infty} \sqrt{\frac{M_{k^{2}}}{\alpha\left(M_{r}\right)}} .
\end{aligned}
$$

Now, we show that $\sum_{r=k^{1}}^{\infty} \sqrt{\frac{M_{k^{2}}}{\alpha\left(M_{r}\right)}} \leq c$. Since, $\alpha$ is strictly monotone increasing we have that $\alpha\left(M_{r}\right) \geq \alpha\left(M_{k^{1}} 2^{r-k^{1}}\right)$. We write for an arbitrary $A$ (we will give more details about $A$ later)

$$
\sum_{r=k^{1}}^{\infty} \sqrt{\frac{1}{\alpha\left(M_{r}\right)}} \leq \sum_{j=0}^{A-1} \sum_{i=0}^{\infty} \sqrt{\frac{1}{\alpha\left(M_{k^{1}} 2^{A i+j}\right)}}
$$

Now, we choose $A$ so big such that the inequality

$$
\sqrt{\alpha\left(M_{k^{1}} 2^{A i+j+A}\right)} \geq \sqrt{\gamma_{1}^{A \log _{\zeta}^{2}} \alpha\left(M_{k^{1}} 2^{A i+j}\right)} \geq 2 \sqrt{\alpha\left(M_{k^{1}} 2^{A i+j}\right)}
$$

holds. (We could choose such an $A$ because $\gamma_{1}, \zeta>1$.) From this

$$
\sum_{r=k^{1}}^{\infty} \sqrt{\frac{1}{\alpha\left(M_{r}\right)}} \leq c \sum_{j=0}^{A-1} \sqrt{\frac{1}{\alpha\left(M_{k^{1}} 2^{j}\right)}} \leq c \sqrt{\frac{1}{\alpha\left(M_{k^{1}}\right)}}
$$

$M_{k^{2}} \leq \alpha(s)$ and $\alpha\left(M_{k^{1}}\right)=\alpha\left(M_{|s|}\right) \geq \alpha\left(s / m_{*}\right) \geq c \alpha(s)$ yields that

$$
\sum_{r=k^{1}}^{\infty} \sqrt{\frac{M_{k^{2}}}{\alpha\left(M_{r}\right)}} \leq c \sqrt{\frac{M_{k^{2}}}{\alpha\left(M_{k^{1}}\right)}} \leq c .
$$

The discussion of the integral $\int_{\overline{I_{k_{1}}\left(x^{1}\right)} \times I_{k^{2}}\left(x^{2}\right)} \sup _{n \in L}\left|\sigma_{n} f\right|$ follows.
Using the substitutions $t=\alpha(s)$ and $s=\alpha^{-1}(t)$, we write that

$$
\overline{I_{|s|}\left(x^{1}\right)} \times I_{|\alpha(s)|}\left(x^{2}\right)=\overline{I_{\left|\alpha^{-1}(t)\right|}\left(x^{1}\right)} \times I_{|t|}\left(x^{2}\right)
$$

That is

$$
\overline{I_{\phi_{1}(s)}\left(x^{1}\right)} \times I_{\phi_{2}(s)}\left(x^{2}\right)=\overline{I_{\tilde{\phi}_{2}(t)}\left(x^{1}\right)} \times I_{\tilde{\phi}_{1}(t)}\left(x^{2}\right)
$$

If $\alpha$ is CRF, then $\alpha^{-1}$ is CRF, too (for more details see [6]). By this

$$
\int_{\overline{I_{\phi_{1}}(s)}\left(x^{1}\right)} \times I_{I_{\phi_{2}}(s)}\left(x^{2}\right) \sup _{n \in L}\left|\sigma_{n} f\right| \leq \int_{\overline{I_{\tilde{\phi}_{2}(t)}\left(x^{1}\right)} \times I_{\bar{\Phi}_{1}(t)}\left(x^{2}\right)} \sup _{n \in \tilde{L}}\left|\sigma_{n} f\right| .
$$

The discussion above gives that

$$
\int_{\overline{I_{k^{1}}\left(x^{1}\right)} \times I_{k^{2}}\left(x^{2}\right)} \sup _{n \in L}\left|\sigma_{n} f\right| \leq c\|f\|_{1} .
$$

The fact that $\int_{G_{m}}\left|K_{n}(y, x)\right| d \mu(y) \leq c$ for all $n \in \mathbb{N}, x \in G_{m}$ (see [3]) implies that the operator $\sigma_{L}^{*}$ is of type $(\infty, \infty)$. This, inequality (3.2) and Lemma 3.3 give by standard argument our theorem.

By the interpolation lemma of Marcinkiewicz [11] and the fact that the operator $\sigma_{L}^{*}$ is sublinear we immediately have the following corollary.

Corollary 3.4. Let $\alpha$ be CRF and $L \in \mathbb{N}_{\alpha}$. Then the operator $\sigma_{L}^{*}$ is of type $(p, p)$ for all $1<p \leq \infty$.
