

## ASYMPTOTIC BEHAVIOR OF SINGULAR AND ENTROPY NUMBERS FOR SOME RIEMANN–LIOUVILLE TYPE OPERATORS

A. MESKHI

**Abstract.** The asymptotic behavior of the singular and entropy numbers is established for the Erdelyi–Köber and Hadamard integral operators (see, e.g., [15]) acting in weighted  $L^2$  spaces. In some cases singular value decompositions are obtained as well for these integral transforms.

**2000 Mathematics Subject Classification:** 47B06, 47B34, 47H50.

**Key words and phrases:** Singular numbers, entropy numbers, Riemann–Liouville operators.

In this paper, we investigate the asymptotic behavior of singular and entropy numbers for the following integral operators:

$$I_{\alpha,\sigma}f(x) = \frac{1}{\Gamma(\alpha)} \int_0^x (x^\sigma - y^\sigma)^{\alpha-1} f(y) dy, \quad x > 0, \quad \alpha > 0, \quad \sigma > 0,$$

(Erdelyi–Köber operator) and

$$H_\alpha f(x) = \frac{1}{\Gamma(\alpha)} \int_1^x \left( \ln \frac{x}{y} \right)^{\alpha-1} f(y) dy, \quad x > 1, \quad \alpha > 0,$$

(Hadamard operator) in some weighted  $L^2$  spaces. We get singular value decompositions for these integral transforms.

Analogous problems for the Riemann–Liouville operator

$$R_\alpha f(x) = \frac{1}{\Gamma(\alpha)} \int_0^x (x - y)^{\alpha-1} f(y) dy, \quad \alpha > 0,$$

were studied in [1]–[6]. We refer also to [7]–[8], where some powerful tools were developed for establishing the asymptotics of singular numbers of certain pseudo-differential operators (see also [9] for some properties of singular numbers for the weighted Riemann–Liouville operator  $R_{\alpha,v}f(x) \equiv v(x)R_\alpha f(x)$ , where  $\alpha > 1/2$ ).

Two-sided estimates of singular (approximation) numbers for the weighted Hardy operator  $\mathcal{H}_{v,w}f(x) = v(x) \int_0^x f(y)w(y) dy$  were given in [10]–[12] (for some related topics concerning the weighted Volterra integral operators see [13], [14]).

Note that some mapping properties of the operators  $I_{\alpha,\sigma}$  and  $H_\alpha$  were established in [15].

Let  $A$  and  $B$  be infinite-dimensional Hilbert spaces. It is known that if  $K : A \rightarrow B$  is an injective compact linear operator, then there exist:

- (a) an orthonormal basis  $\{u_j\}_{Z_+}$  in  $A$ ;
- (b) an orthonormal basis  $\{v_j\}_{Z_+}$  in  $B$ ;
- (c) a nonincreasing sequence  $\{s_j(K)\}_{Z_+}$  of positive numbers with limit 0 as  $j \rightarrow +\infty$  such that

$$Ku_j = s_j(K)v_j, \quad j \in Z_+.$$

The numbers  $s_j(K)$  are known as singular numbers or  $s$ -numbers of the operator  $K$ , the system  $\{s_j(K), u_j, v_j\}_{j \in Z_+}$  is called a singular system of  $K$ . For the operator  $K$  the singular value decomposition

$$Kf = \sum_{j=0}^{\infty} s_j(K)(f, u_j)_A v_j, \quad f \in A,$$

is valid.

Let  $w$  be a measurable a.e. positive function on  $\Omega \subset R_+$ . We denote by  $L_w^2(\Omega)$  the class of all measurable functions  $f : \Omega \rightarrow R_+$  for which

$$\|f\|_{L_w^2(\Omega)} = \left( \int_{\Omega} |f(x)|^2 w(x) dx \right)^{1/2} < \infty.$$

In the sequel by writing  $a_n \approx b_n$  for sequences of positive numbers  $a_n$  and  $b_n$  we mean that there exist positive constants  $c_1$  and  $c_2$  such that  $c_1 \leq a_n/b_n \leq c_2$  for all  $n \in \mathbb{N}$ .

The following result is well-known (see [5]):

**Theorem A.** *Let  $\alpha > 0$ ,  $\beta > -1$ ,  $\varphi(t) = t^{-\beta}e^{-t}$ ,  $\psi(t) = t^{-(\alpha+\beta)}e^{-t}$ . Then the singular system  $\{s_j(R_\alpha), u_j, v_j\}_{j \in Z_+}$  of the operator  $R_\alpha : L_\varphi^2(R_+) \rightarrow L_\psi^2(R_+)$  is given by*

$$\begin{aligned} s_n(R_\alpha) &= \left( \frac{\Gamma(n + \beta + 1)}{\Gamma(n + \alpha + \beta + 1)} \right)^{1/2}, \\ u_n(t) &= \left( \frac{n!}{\Gamma(n + \beta + 1)} \right)^{1/2} t^\beta L_n^{(\beta)}(t), \\ v_n(t) &= \left( \frac{n!}{\Gamma(n + \alpha + \beta + 1)} \right)^{1/2} t^{\alpha+\beta} L_n^{(\alpha+\beta)}(t), \end{aligned} \tag{1}$$

and  $s_n(R_\alpha)/n^{-\alpha/2} \rightarrow 1$  as  $n \rightarrow \infty$ , where  $L_n^{(\gamma)}$  is the Laguerre polynomial:

$$L_n^{(\gamma)}(x) = \sum_{k=0}^n (-1)^k \binom{n + \gamma}{n - k} \frac{x^k}{k!}, \quad \gamma > -1, \quad n \in Z_+.$$

**Theorem B ([4]).** *Let  $\alpha > 0$ ,  $\lambda > \alpha - 1/2$ ,  $\lambda \neq 0$ . Then the operator  $R_\alpha : L^2_\varphi(R_+) \rightarrow L^2_\psi(R_+)$ , where  $\varphi(x) = x^{1/2-\lambda}(1+x)^{2\alpha}$ ,  $\psi(x) = x^{1/2-\lambda-\alpha}$ , has the following singular system:*

$$\begin{aligned}
 s_n(R_\alpha) &= \left( \frac{\Gamma(n + \lambda - \alpha + 1/2)}{\Gamma(n + \lambda + \alpha + 1/2)} \right)^{1/2}, \\
 u_n(t) &= 2^\lambda a_n t^{\lambda-1/2} (1+t)^{-\lambda-\alpha-1/2} C_n^\lambda \left( \frac{1-t}{1+t} \right), \\
 v_n(t) &= 2^\lambda b_n t^{\lambda+\alpha-1/2} (1+t)^{-\lambda-\alpha-3/2} P_n^{(\lambda-\alpha-1/2, \lambda+\alpha-1/2)} \left( \frac{1-t}{1+t} \right),
 \end{aligned}
 \tag{2}$$

where

$$\begin{aligned}
 a_n &= \left( \frac{2^{2\lambda-1} (n + \lambda) n!}{\pi \Gamma(n + 2\lambda)} \right)^{1/2} \Gamma(\lambda), \\
 b_n &= \left( \frac{2^{1-2\lambda} (n + \lambda) n! \Gamma(n + 2\lambda)}{\Gamma(n + \lambda - \alpha + 1/2) \Gamma(n + \lambda + \alpha + 1/2)} \right)^{1/2},
 \end{aligned}$$

$C_n^\lambda(t)$  is the Gegenbauer polynomial

$$C_n^\lambda(t) = \frac{1}{\Gamma(\alpha)} \sum_{j=0}^{[n/2]} (-1)^j \frac{\Gamma(\alpha + n - j)}{j!(n - 2j)!} (2t)^{n-2j},$$

and  $P_m^{(\alpha, \beta)}$  is the Jacobi polynomial

$$P_n^{(\alpha, \beta)}(t) = 2^{-n} \sum_{m=0}^n \binom{n + \alpha}{m} \binom{n + \beta}{n - m} (t - 1)^{n-m} (t + 1)^m, \quad n \in Z_+.$$

Moreover,  $\lim_{n \rightarrow \infty} s_n(R_\alpha)/n^{-\alpha} = 1$ .

**Theorem C ([6]).** *The singular values of the operator  $R_\alpha : L^2(0, 1) \rightarrow L^2_{x^{-\gamma}}(0, 1)$  have the following asymptotics:*

$$s_n(R_\alpha) \approx n^{-\alpha}, \quad 0 \leq \gamma < \alpha.$$

When  $\gamma = 0$ , the upper estimate in the previous statement was derived in [1], [2], while the lower estimate was given in [2].

The following lemma follows immediately:

**Lemma 1.** *Let  $\varphi, \psi, v$  and  $w$  be measurable a.e. positive functions on  $\Omega \subseteq R_+$ . Then the operator  $A$  is compact from  $L^2_\varphi(\Omega)$  to  $L^2_\psi(\Omega)$  if and only if the operator  $A_1 f(x) = v^{1/2}(x)A(fw^{-1/2})(x)$  is compact from  $L^2_{\varphi w^{-1}}(\Omega)$  to  $L^2_{\psi v^{-1}}(\Omega)$ .*

Taking into account the definition of the singular system of the operator, we easily derive the next statement.

**Lemma 2.** *Let  $v$  and  $w$  be a.e. positive measurable functions on  $\Omega \subseteq R_+$ . A system  $\{s_j(A), u_j, v_j\}_{j \in Z_+}$  is a singular system for the operator  $A : L^2_\varphi(\Omega) \rightarrow L^2_\psi(\Omega)$  if and only if the operator  $A_1 : L^2_{\varphi w^{-1}}(\Omega) \rightarrow L^2_{\psi v^{-1}}(\Omega)$  has the singular*

system  $\{s_j(A_1), w^{1/2}u_j, v^{1/2}v_j\}_{j \in \mathbb{Z}_+}$ , where  $A_1 f(x) = v^{1/2}(x)A(fw^{-1/2})(x)$  and  $s_j(A_1) = s_j(A)$ .

Let  $\mathcal{I}_{\alpha, \sigma} f(x) = I_{\alpha, \sigma}(f\rho)(x)$ , where  $\rho(y) = y^{\sigma-1}$ ,  $\alpha > 0$ ,  $\sigma > 0$  and  $x > 0$ . From the definition of compactness we easily deduce

**Lemma 3.** *Let  $\alpha > 0$ ,  $\sigma > 0$  and let  $\Omega = (0, 1)$  or  $\Omega = (0, \infty)$ . Assume that  $v$  and  $w$  are measurable a.e. positive functions on  $\Omega$ . Then the operator  $\mathcal{I}_{\alpha, \sigma}$  is compact from  $L_w^2(\Omega)$  to  $L_v^2(\Omega)$  if and only if  $R_\alpha$  is compact from  $L_W^2(\Omega)$  to  $L_V^2(\Omega)$ , where  $W(x) = w(x^{1/\sigma})x^{1/\sigma-1}$ ,  $V(x) = v(x^{1/\sigma})x^{1/\sigma-1}$ .*

Now we prove the following statement:

**Lemma 4.** *Let  $\alpha > 0$ ,  $\sigma > 0$  and let  $v$  and  $w$  be measurable a.e. positive functions on  $\Omega$ , where  $\Omega = (0, \infty)$  or  $\Omega = (0, 1)$ . Then for the singular system  $\{s_j(\mathcal{I}_{\alpha, \sigma}), \bar{u}_j, \bar{v}_j\}_{j \in \mathbb{Z}_+}$  of the operator  $\mathcal{I}_{\alpha, \sigma} : L_w^2(\Omega) \rightarrow L_v^2(\Omega)$  we have  $s_j(\mathcal{I}_{\alpha, \sigma}) = \sigma^{-1}s_j(R_\alpha)$ ,  $\bar{u}_j(x) = \sigma^{1/2}u_j(x^\sigma)$ ,  $\bar{v}_j(x) = \sigma^{1/2}v_j(x^\sigma)$ , where  $\{s_j(R_\alpha), u_j, v_j\}_{j \in \mathbb{Z}_+}$  is a singular system for the operator  $R_\alpha : L_W^2(0, \infty) \rightarrow L_V^2(0, \infty)$ , with  $W(x) = w(x^{1/\sigma})x^{1/\sigma-1}$  and  $V(x) = v(x^{1/\sigma})x^{1/\sigma-1}$ .*

*Proof.* Let  $\Omega = (0, \infty)$ . Using the change of variable  $y = t^{1/\sigma}$ , we have

$$\begin{aligned} (\mathcal{I}_{\alpha, \sigma} \bar{u}_j)(x) &= \frac{1}{\Gamma(\alpha)} \int_0^x (x^\sigma - y^\sigma)^{\alpha-1} y^{\sigma-1} \bar{u}_j(y) dy \\ &= \frac{\sigma^{1/2}}{\Gamma(\alpha)} \int_0^x (x^\sigma - y^\sigma)^{\alpha-1} u_j(y^\sigma) y^{\sigma-1} dy = \frac{\sigma^{-1/2}}{\Gamma(\alpha)} \int_0^{x^\sigma} (x^\sigma - t)^{\alpha-1} u_j(t) dt \\ &= \sigma^{-1/2} (R_\alpha u_j)(x^\sigma) = s_j(R_\alpha) \sigma^{-1/2} v_j(x^\sigma) = \sigma^{-1} s_j(R_\alpha) \bar{v}_j(x). \end{aligned}$$

Further, the change of variable yields

$$\begin{aligned} \int_0^\infty \bar{v}_j(x) \bar{v}_i(x) v(x) dx &= \sigma \int_0^\infty v_j(x^\sigma) v_i(x^\sigma) V(x^\sigma) x^{\sigma-1} dx \\ &= \int_0^\infty v_j(x) v_i(x) V(x) dx = \delta_{ij}, \end{aligned}$$

where  $\delta_{ij}$  denotes Kronecker's symbol.

Analogously, we have

$$\int_0^\infty \bar{u}_j(x) \bar{u}_i(x) w(x) dx = \int_0^\infty u_j(x) u_i(x) W(x) dx = \delta_{ij},$$

Hence  $\{\bar{v}_j\}$  and  $\{\bar{u}_j\}$  are orthonormal systems in  $L_v^2(\mathbb{R}_+)$  and  $L_w^2(\mathbb{R}_+)$ , respectively.

The case  $\Omega = (0, 1)$  follows in a similar way.  $\square$

**Theorem 1.** *Let  $\alpha > 0$ ,  $\sigma > 0$  and  $0 \leq \gamma < \alpha$ . Then there exist positive constants  $c_1$  and  $c_2$  depending on  $\alpha$ ,  $\sigma$  and  $\gamma$  such that for the singular numbers of the operator  $I_{\alpha,\sigma} : L_{x^{1-\sigma}}^2(0, 1) \rightarrow L_{x^{\sigma-1-\gamma\sigma}}^2(0, 1)$  we have  $s_n(I_{\alpha,\sigma}) \approx n^{-\alpha}$ .*

*Proof.* By Lemma 2 we have that  $s_j(I_{\alpha,\sigma}) = s_j(\mathcal{I}_{\alpha,\sigma})$ , where  $\mathcal{I}_{\alpha,\sigma}$  acts from  $L_{x^{\sigma-1}}^2(0, 1)$  to  $L_{x^{\sigma-1-\gamma\sigma}}^2(0, 1)$ , while Lemma 4 yields  $s_j(\mathcal{I}_{\alpha,\sigma}) = 1/\sigma s_j(R_\alpha)$ , where  $R_\alpha$  is the Riemann–Liouville operator acting from  $L^2(0, 1)$  to  $L_{x^{-\gamma}}^2(0, 1)$ . Theorem C completes the proof.  $\square$

**Theorem 2.** *Let  $\alpha > 0$ ,  $\sigma > 0$ ,  $\lambda > \alpha - 1/2$  and  $\lambda \neq 0$ . Assume that  $w(x) = x^{1-\sigma/2-\sigma\lambda}(1+x^\sigma)^{2\alpha}$ ,  $v(x) = x^{3\sigma/2-\sigma\lambda-\sigma\alpha-1}$ . Then the operator  $I_{\alpha,\sigma} : L_w^2(0, \infty) \rightarrow L_v^2(0, \infty)$  has a singular system  $\{s_n(I_{\alpha,\sigma}), \bar{u}_n, \bar{v}_n\}_{n \in \mathbb{Z}_+}$ , where*

$$s_n(I_{\alpha,\sigma}) = 1/\sigma \left( \frac{\Gamma(n + \lambda - \alpha + 1/2)}{\Gamma(n + \lambda + \alpha + 1/2)} \right)^{1/2},$$

$$\bar{u}_n(x) = \sigma^{1/2} 2^\lambda a_n x^{\sigma(\lambda+1/2)-1} (1+x^\sigma)^{-\lambda-\alpha-1/2} C_n^\lambda \left( \frac{1-x^\sigma}{1+x^\sigma} \right),$$

$$\bar{v}_n(x) = \sigma^{1/2} 2^\lambda b_n x^{\sigma(\lambda+\alpha-1/2)} (1+x^\sigma)^{-\lambda-\alpha-3/2} P_n^{\lambda-\alpha-1/2, \lambda+\alpha-1/2} \left( \frac{1-x^\sigma}{1+x^\sigma} \right),$$

$C_n^\lambda(x)$  and  $P_n^{\alpha,\beta}$  are Gegenbauer and Jacobi polynomials, respectively (see Theorem B), and  $a_n, b_n$  are the constants defined in Theorem B. Moreover,

$$\lim_{n \rightarrow \infty} s_n(I_{\alpha,\sigma})/n^{-\alpha} = 1/\sigma.$$

*Proof.* Lemma 2 implies that the singular system  $\{s_m(I_{\alpha,\sigma}), \bar{u}_m, \bar{v}_m\}_{m \in \mathbb{Z}_+}$  of the map  $I_{\alpha,\sigma} : L_w^2(0, \infty) \rightarrow L_v^2(0, \infty)$  coincides with the singular system  $\{s_m(\mathcal{I}_{\alpha,\sigma}), \tilde{u}_m, \tilde{v}_m\}_{m \in \mathbb{Z}_+}$  of the map  $\mathcal{I}_{\alpha,\sigma} : L_W^2(0, \infty) \rightarrow L_V^2(0, \infty)$ , where  $W(x) = w(x)x^{2(\sigma-1)}$ ,  $V(x) = v(x)$ ,  $\tilde{u}_m(x) = x^{1-\sigma}u_m(x)$ ,  $\tilde{v}_m(x) = \bar{v}_m(x)$ . Further, by Lemma 4 we have that the operator  $R_\alpha : L_\varphi^2(0, \infty) \rightarrow L_\psi^2(0, \infty)$  ( $\varphi(x) = x^{1/2-\lambda}(1+x)^\alpha$ ,  $\psi(x) = x^{1/2-\lambda-\alpha}$ ) has a singular system  $\{s_m(R_\alpha), u_m, v_m\}_{m \in \mathbb{Z}_+}$ , where

$$s_m(R_\alpha) = \sigma s_m(\mathcal{I}_{\alpha,\sigma}) \approx m^{-\alpha}, \quad \bar{u}_m(x) = \sigma^{1/2} x^{\sigma-1} u_m(x^\sigma), \quad \bar{v}_m(x) = \sigma^{1/2} v_m(x^\sigma). \quad \square$$

Analogously, we have

**Theorem 3.** *Let  $\alpha > 0$ ,  $\sigma > 0$ ,  $\beta > -1$ ,  $w(y) = y^{-\sigma\beta-\sigma+1}e^{-y^\sigma}$  and  $v(y) = y^{-\sigma(\alpha+\beta)+\sigma-1}e^{-y^\sigma}$ . Then the operator  $I_{\alpha,\sigma} : L_w^2(0, \infty) \rightarrow L_v^2(0, \infty)$  has a singular system  $\{s_m(I_{\alpha,\sigma}), \bar{u}_m, \bar{v}_m\}_{m \in \mathbb{Z}_+}$  defined by*

$$s_n(I_{\alpha,\sigma}) = 1/\sigma \left( \frac{\Gamma(n + \beta + 1)}{\Gamma(n + \alpha + \beta + 1)} \right)^{1/2},$$

$$\bar{u}_n(x) = \sigma^{1/2} x^{\sigma-1+\sigma\beta} \left( \frac{n!}{\Gamma(n + \beta + 1)} \right)^{1/2} L_n^{(\beta)}(x^\sigma),$$

$$\bar{v}_n(x) = \sigma^{1/2} \left( \frac{n!}{\Gamma(n + \alpha + \beta + 1)} \right)^{1/2} x^{\sigma(\alpha+\beta)} L_n^{(\alpha+\beta)}(x^\sigma),$$

where  $L_n^{(\gamma)}(x)$  is a Laguerre polynomial (see Theorem A). Moreover,

$$\lim_{n \rightarrow \infty} s_n(I_{\alpha,\sigma})/n^{-\alpha/2} = 1/\sigma.$$

Now we consider the operator of Hadamard’s type  $H_\alpha$ .

The following lemma holds:

**Lemma 5.** *Let  $\alpha > 0$  and  $(v, w)$  be a pair of weights defined on  $(1, \infty)$ . Then  $\{s_m(L_\alpha), \bar{u}_m, \bar{v}_m\}_{m \in \mathbb{Z}_+}$  is a singular system for the operator  $L_\alpha : L_w^2(1, \infty) \rightarrow L_v^2(1, \infty)$ , where*

$$L_\alpha f(x) = \frac{1}{\Gamma(\alpha)} \int_1^x \left(\ln \frac{x}{y}\right)^{\alpha-1} f(y) \frac{dy}{y},$$

if and only if the Riemann–Liouville operator  $R_\alpha : L_W^2(0, \infty) \rightarrow L_V^2(0, \infty)$  has a singular system  $\{s_m(R_\alpha), \tilde{u}_m, \tilde{v}_m\}_{m \in \mathbb{Z}_+}$ , where  $W(x) = w(e^x)e^x$ ,  $V(x) = v(e^x)e^x$ ,  $s_m(R_\alpha) = s_m(L_\alpha)$ ,  $\tilde{u}_m(x) = \bar{u}_m(e^x)$ ,  $\tilde{v}_m(x) = \bar{v}_m(e^x)$ .

*Proof.* Using the change of variable  $y = e^z$  we have

$$\begin{aligned} (L_\alpha \bar{u}_m)(x) &= \frac{1}{\Gamma(\alpha)} \int_1^x \left(\ln \frac{x}{y}\right)^{\alpha-1} \bar{u}_m(y) \frac{dy}{y} \\ &= \frac{1}{\Gamma(\alpha)} \int_0^{\ln x} (\ln x - z)^{\alpha-1} \tilde{u}_m(z) dz = (R_\alpha \tilde{u}_m)(\ln x) = \tilde{v}(\ln x) s_j(R_\alpha). \end{aligned}$$

On the other hand,

$$\begin{aligned} \int_0^\infty \tilde{u}_i(x) \tilde{u}_j(x) W(x) dx &= \int_0^\infty \bar{u}_i(e^x) \bar{u}_j(e^x) w(e^x) e^x dx = \delta_{ij}, \\ \int_0^\infty \tilde{v}_i(x) \tilde{v}_j(x) V(x) dx &= \int_1^\infty \bar{v}_i(y) \bar{v}_j(y) v(y) dy = \delta_{ij}, \end{aligned}$$

where  $\delta_{ij}$  is Kronecker’s symbol.  $\square$

Lemmas 2 and 5 yield the following statements:

**Theorem 4.** *Let  $\alpha > 0$ ,  $\beta > -1$ ,  $w(x) = \ln^{-\beta} x$ ,  $v(x) = x^{-2} \ln^{-(\alpha+\beta)} x$ . Then the operator  $H_\alpha : L_w^2(1, \infty) \rightarrow L_v^2(1, \infty)$  has a singular system  $\{s_n(H_\alpha), \tilde{u}_n, \tilde{v}_n\}_{n \in \mathbb{Z}_+}$ , where  $s_n(H_\alpha) = s_n(R_\alpha)$  ( $s_m(R_\alpha)$  is defined by (1)),*

$$\begin{aligned} \tilde{u}_n(x) &= x^{-1} \left(\frac{n!}{\Gamma(n + \beta + 1)}\right)^{1/2} L_n^{(\beta)}(\ln x) \ln^\beta x, \\ \tilde{v}_n(x) &= \left(\frac{n!}{\Gamma(n + \alpha + \beta + 1)}\right)^{1/2} L_n^{(\alpha+\beta)}(\ln x) \ln^{\alpha+\beta} x, \end{aligned}$$

and  $L_n^{(\gamma)}$  is the Laguerre polynomial. Moreover,

$$\lim_{n \rightarrow \infty} s_n(H_\alpha)/n^{-\alpha/2} = 1.$$

**Theorem 5.** *Let  $\lambda > \alpha - \frac{1}{2}$ ,  $\lambda \neq 0$ . Then the operator  $H_\alpha : L_w^2(1, \infty) \rightarrow L_v^2(1, \infty)$  has a singular system  $\{s_n(H_\alpha), \tilde{u}_m, \tilde{v}_n\}_{m \in \mathbb{Z}_+, n \in \mathbb{Z}_+}$ , where  $v(x) = x^{-1} \ln^{1/2-\lambda-\alpha} x$ ,  $w(x) = (1 + \ln x)^{2\alpha} x \ln^{1/2-\lambda} x$ ,  $s_n(H_\alpha) = s_n(R_\alpha)$  ( $s_n(R_\alpha)$  is defined by (2)),*

$$\begin{aligned} \tilde{u}_n(x) &= 2^\lambda a_n (1 + \ln x)^{-\lambda-\alpha-1/2} C_n^\lambda \left( \frac{1 - \ln x}{1 + \ln x} \right) x^{-1} \ln^{\lambda-1/2} x, \\ v_n(x) &= 2^\lambda b_n (1 + \ln x)^{-\lambda-\alpha-3/2} P_n^{(\lambda-\alpha-1/2, \lambda+\alpha-1/2)} \left( \frac{1 - \ln x}{1 + \ln x} \right) \ln^{\lambda+\alpha-1/2} x. \end{aligned}$$

Moreover,

$$\lim_{n \rightarrow \infty} s_n(H_\alpha) / n^{-\alpha} = 1.$$

**Definition 1.** Let  $X$  and  $Y$  be Banach spaces and let  $T$  be a bounded linear map from  $X$  to  $Y$ . Then for all  $k \in \mathbb{N}$ , the  $k^{\text{th}}$  entropy number  $e_k(T)$  of  $T$  is defined by

$$e_k(T) = \inf \left\{ \varepsilon > 0 : T(U_X) \subset \bigcup_{j=1}^{2^{k-1}} (b_j + \varepsilon U_Y) \text{ for some } b_1, \dots, b_{2^{k-1}} \in Y \right\},$$

where  $U_X$  and  $U_Y$  are the closed unit balls in  $X$  and  $Y$ , respectively.

It is easy to verify that  $\|T\| = e_1(T) \geq e_2(T) \geq \dots \geq 0$ .

For other properties of the entropy numbers see, e.g., [16].

It is known (see, e.g., [15]), that if  $T$  is a compact linear map of a Hilbert space  $X$  into a Hilbert space  $Y$ , then  $s_n(T) \approx n^{-\lambda}$  if and only if  $e_n(T) \approx n^{-\lambda}$ . Hence we can get asymptotics of the entropy numbers for the operators  $I_{\alpha,\sigma}$  and  $H_\alpha$ . In particular, Theorems 1, 2 and 3 yield

**Proposition 1.** *Let  $\alpha > 0$  and  $\sigma > 0$ . Then the following statements are valid:*

(a) *If  $0 \leq \gamma < \alpha$ , then the asymptotic formula*

$$e_n(I_{\alpha,\sigma}) \approx n^{-\alpha} \tag{3}$$

*holds for the operator  $I_{\alpha,\sigma} : L_{x^{1-\sigma}}^2(0, 1) \rightarrow L_{x^{\sigma-1-\gamma\sigma}}^2(0, 1)$ .*

(b) *Assume that  $\lambda > \alpha - 1/2$  and  $\lambda \neq 0$ . Then the asymptotic formula (3) is valid for the map  $I_{\alpha,\sigma} : L_w^2(0, \infty) \rightarrow L_v^2(0, \infty)$ , where  $w(x) = x^{-\sigma/2-\sigma\lambda+1} (1 + x^\sigma)^{2\alpha}$  and  $v(x) = x^{3\sigma/2-\sigma\lambda-\sigma\alpha-1}$ .*

(c) *For the entropy numbers  $e_n(I_{\alpha,\sigma})$  of the operator  $I_{\alpha,\sigma} : L_w^2(0, \infty) \rightarrow L_v^2(0, \infty)$  ( $w(y) = y^{-\sigma\beta-\sigma+1} e^{-y^\sigma}$ ,  $v(y) = y^{-\sigma(\alpha+\beta)+\sigma-1} e^{-y^\sigma}$ ,  $\beta > -1$ ) we have*

$$e_n(I_{\alpha,\sigma}) \approx n^{-\alpha/2}.$$

Let  $T : L_w^2 \rightarrow L_v^2$  be a compact linear operator. We shall denote by  $n(t, T)$  the distribution function of singular values for the operator  $T$ , i.e.,

$$n(t, T) \equiv \#\{k : s_k(T) > t\}.$$

**Theorem 6.** *Let  $\alpha > 1/2$  and  $\sigma > 0$ . Assume that  $v$  is a measurable a.e. positive function of  $(0, \infty)$  satisfying the condition*

$$\sum_{k \in \mathbb{Z}} \left( \int_{2^{k/\sigma}}^{2^{(k+1)/\sigma}} v(y)y^{(2\alpha-1)\sigma} dy \right)^{1/(2\alpha)} < \infty. \tag{4}$$

*Then for the operator  $I_{\alpha,\sigma} : L_w^2(R_+) \rightarrow L_v^2(R_+)$ , where  $w(x) = x^{1-\sigma}$ , the asymptotic formula*

$$\lim_{t \rightarrow 0} t^{1/\alpha} n(t, I_{\alpha,\sigma}) = \frac{\sigma^{-1/\alpha+1}}{\pi} \int_0^\infty v^{1/(2\alpha)}(y)y^{(1-\sigma)(1/(2\alpha)-1)} dy$$

*holds.*

*Proof.* Condition (4) implies that

$$\sum_{k \in \mathbb{Z}} \left( \int_{2^k}^{2^{k+1}} \bar{v}^2(y)y^{2\alpha-1} dy \right)^{1/(2\alpha)} < \infty, \tag{5}$$

where  $\bar{v}(x) \equiv [v(x^{1/\sigma})x^{1/\sigma-1}]^{1/2}$ . By virtue of Theorem 1 from [9] we have that for the operator  $R_{\alpha,\bar{v}} : L^2(R_+) \rightarrow L^2(R_+)$ , where  $R_{\alpha,\bar{v}}f(x) \equiv \bar{v}(x)R_\alpha f(x)$ , the asymptotic formula

$$\lim_{t \rightarrow 0} t^{1/\alpha} n(t, R_{\alpha,\bar{v}}) = \pi^{-1} \int_{R_+} \bar{v}^{1/\alpha}(x) dx$$

holds. Further, using Lemmas 1, 2 and 3 we obtain that  $s_k(R_{\alpha,\bar{v}}) = \sigma \cdot s_k(I_{\alpha,\sigma})$ . Consequently,

$$\begin{aligned} \lim_{t \rightarrow 0} t^{1/\alpha} n(t, I_{\alpha,\sigma}) &= \sigma^{-1/\alpha} \lim_{t \rightarrow 0} t^{1/\alpha} n(t, R_{\alpha,\bar{v}}) \\ &= \sigma^{-1/\alpha} \frac{1}{\pi} \int_0^\infty (\bar{v}(x))^{1/\alpha} dx = \frac{\sigma^{-1/\alpha+1}}{\pi} \int_0^\infty (v(y))^{1/(2\alpha)} y^{(1-\sigma)(1/(2\alpha)-1)} dy. \quad \square \end{aligned}$$

**Theorem 7.** *Let  $\alpha > 1/2$  and  $\sigma > 0$ . Suppose that  $v$  is a measurable a.e. positive function on  $(0, 1)$  satisfying the condition*

$$\sum_{k \in \mathbb{Z}} \left( \int_{a_k}^{a_{k+1}} v(x)x^{-\sigma+2\alpha\sigma}(1-x^\sigma)^{-1} dx \right)^{1/(2\alpha)} < \infty, \quad a_k = (2^k/(2^k + 1))^{1/\sigma}. \tag{6}$$

*Then for the operator  $I_{\alpha,\sigma}$  acting from  $L_w^2(0, 1)$  into  $L_v^2(0, 1)$ , where  $w(x) = (1-x^\sigma)^{2\alpha}x^{1-\sigma}$ , we have*

$$\lim_{t \rightarrow 0} t^{1/\alpha} n(t, I_{\alpha,\sigma}) = \frac{\sigma^{-1/\alpha+1}}{\pi} \int_0^1 v^{1/(2\alpha)}(x)x^{(1-\sigma)(1/(2\alpha)-1)}(1-x^\sigma)^{-1} dx.$$

*Proof.* Using Lemmas 1–4 we have that  $s_n(I_{\alpha,\sigma}) = 1/\sigma s_n(R_\alpha)$ , where  $R_\alpha$  is the Riemann–Liouville operator acting from  $L_{w_1}^2(0, 1)$  into  $L_{v_1}^2(0, 1)$ , with

$$w_1(x) = w(x^{1/\sigma})x^{1-1/\sigma}, \quad v_1(x) = v(x^{1/\sigma})x^{1/\sigma-1}.$$

Further, by the change of variable  $x = y/(1 - y)$  we obtain that the operator  $\overline{R}_\alpha : L_{w_2}^2(R_+) \rightarrow L_{v_2}^2(R_+)$  has singular numbers  $s_n(\overline{R}_\alpha) = \sigma s_n(I_{\alpha,\sigma})$ , where  $w_2(x) = w_1(x/(x+1))(x+1)^{-2}$ ,  $v_2(x) = v_1(x/(x+1))(x+1)^{-2}$  and  $\overline{R}_\alpha f(x) = \psi(x)R_\alpha(f\varphi)(x)$  with  $\psi(x) = (x+1)^{-\alpha+1}$ ,  $\varphi(x) = (x+1)^{-1-\alpha}$ . Hence for the singular numbers of the Riemann–Liouville operator  $R_\alpha : L_{w_3}^2(R_+) \rightarrow L_{v_3}^2(R_+)$  we derive  $s_n(R_\alpha) = \sigma s_n(I_{\alpha,\sigma})$ , where  $w_3(x) = w_2(x)(x+1)^{2\alpha+2} = 1$  and  $v_3(x) = v_2(x)(x+1)^{2-2\alpha}$ . Further, condition (6) implies (5) with  $v_3$  instead of  $v$ . Thus, taking into account Theorem 1 from [9], we arrive at

$$\begin{aligned} \lim_{t \rightarrow 0} t^{1/\alpha} n(t, I_{\alpha,\sigma}) &= \sigma^{-1/\alpha} \lim_{t \rightarrow 0} t^{1/\alpha} n(t, R_\alpha) \\ &= \sigma^{-1/\alpha} \frac{1}{\pi} \int_0^\infty v_4^{1/\alpha}(x) dx = \frac{\sigma^{-1/\alpha+1}}{\pi} \int_0^1 (v(y))^{1/(2\alpha)} y^{(1-\sigma)(1/(2\alpha)-1)} (1-y^\sigma)^{-1} dy. \end{aligned}$$

In the last equality we used the change of variable twice.  $\square$

Finally, we have

**Theorem 8.** *Let  $\alpha > 1/2$  and let  $v$  be a measurable a.e. positive function on  $(1, \infty)$  satisfying the condition*

$$\sum_{k \in \mathbb{Z}} \left( \int_{a_k}^{a_{k+1}} v(x) \ln^{2\alpha-1} x dx \right)^{1/(2\alpha)} < \infty, \quad a_k = e^{2^k}. \quad (7)$$

*Then for the operator  $H_\alpha : L_w^2(1, \infty) \rightarrow L_v^2(1, \infty)$ , where  $w(x) = e^x$ , the asymptotic formula*

$$\lim_{t \rightarrow 0} t^{1/\alpha} n(t, H_{\alpha,\sigma}) = \frac{1}{\pi} \int_1^\infty v^{1/(2\alpha)}(x) x^{1/(2\alpha)-1} dy \quad (8)$$

*holds.*

*Proof.* Taking into account Lemmas 2 and 5 we obtain that  $s_n(R_\alpha) = s_n(H_\alpha)$ , where  $R_\alpha$  is the Riemann–Liouville operator acting from  $L^2(R_+)$  into  $L_{v_1}^2(R_+)$ ,  $v_1(x) = v(e^x)e^x$ . By condition (7), Theorem 1 from [9] and the change of variable  $x = e^y$  we conclude that (8) holds.  $\square$
