A general hierarchical problem has been considered, and an explicit algorithm has been presented for solving this hierarchical problem. Also, it is shown that the suggested algorithm converges strongly to a solution of the hierarchical problem.

## 1. Introduction

Let  $H$  be a real Hilbert space with inner product  $\langle \cdot, \cdot \rangle$  and norm  $\| \cdot \|$ , respectively. Let  $C$  be a nonempty closed convex subset of  $H$ . The hierarchical problem is of finding  $\tilde{x} \in \text{Fix}(T)$  such that

$$\langle S\tilde{x} - \tilde{x}, x - \tilde{x} \rangle \leq 0, \quad \forall x \in \text{Fix}(T), \quad (1.1)$$

where  $S, T$  are two nonexpansive mappings and  $\text{Fix}(T)$  is the set of fixed points of  $T$ . Recently, this problem has been studied by many authors (see, e.g., [1–15]). The main reason is that this problem is closely associated with some monotone variational inequalities and convex programming problems (see [16–19]).

Now, we briefly recall some historic results which relate to the problem (1.1).

For solving the problem (1.1), in 2006, Moudafi and Mainge [1] first introduced an implicit iterative algorithm:

$$x_{t,s} = sQ(x_{t,s}) + (1-s)[tS(x_{t,s}) + (1-t)T(x_{t,s})] \quad (1.2)$$

and proved that the net  $\{x_{t,s}\}$  defined by (1.2) strongly converges to  $x_t$  as  $s \rightarrow 0$ , where  $x_t$  satisfies  $x_t = \text{proj}_{\text{Fix}(P_t)} Q(x_t)$ , where  $P_t : C \rightarrow C$  is a mapping defined by

$$P_t(x) = tS(x) + (1-t)T(x), \quad \forall x \in C, \quad t \in (0,1), \quad (1.3)$$

or, equivalently,  $x_t$  is the unique solution of the quasivariational inequality

$$0 \in (I - Q)x_t + N_{\text{Fix}(P_t)}(x_t), \quad (1.4)$$

where the normal cone to  $\text{Fix}(P_t)$ ,  $N_{\text{Fix}(P_t)}$ , is defined as follows:

$$N_{\text{Fix}(P_t)} : x \longrightarrow \begin{cases} \{u \in H : \langle y - x, u \rangle \leq 0\}, & \text{if } x \in \text{Fix}(P_t), \\ \emptyset, & \text{otherwise.} \end{cases} \quad (1.5)$$

Moreover, as  $t \rightarrow 0$ , the net  $\{x_t\}$  in turn weakly converges to the unique solution  $x_\infty$  of the fixed point equation  $x_\infty = \text{proj}_\Omega Q(x_\infty)$  or, equivalently,  $x_\infty$  is the unique solution of the variational inequality

$$0 \in (I - Q)x_\infty + N_\Omega(x_\infty). \quad (1.6)$$

Recently, Moudafi [2] constructed an explicit iterative algorithm:

$$x_{n+1} = (1 - \delta_n)x_n + \delta_n(\sigma_n Sx_n + (1 - \sigma_n)Tx_n), \quad \forall n \geq 0, \quad (1.7)$$

where  $\{\delta_n\}$  and  $\{\sigma_n\}$  are two real numbers in  $(0,1)$ . By using this iterative algorithm, Moudafi [2] only proved a weak convergence theorem for solving the problem (1.1).

In order to obtain a strong convergence result, Mainge and Moudafi [3] further introduced the following iterative algorithm:

$$x_{n+1} = (1 - \delta_n)Qx_n + \delta_n[\sigma_n Sx_n + (1 - \sigma_n)Tx_n], \quad \forall n \geq 0, \quad (1.8)$$

where  $\{\delta_n\}$  and  $\{\sigma_n\}$  are two real numbers in  $(0,1)$ , and proved that, under appropriate conditions, the iterative sequence  $\{x_n\}$  generated by (1.8) has strong convergence.

Subsequently, some authors have studied some algorithms on hierarchical fixed problems (see, e.g., [4–15]).

Motivated and inspired by the results in the literature, in this paper, we consider a general hierarchical problem of finding  $\tilde{x} \in \text{Fix}(T)$  such that, for any  $n \geq 1$ ,

$$\langle W_n \tilde{x} - \tilde{x}, x - \tilde{x} \rangle \leq 0, \quad \forall x \in \text{Fix}(T), \quad (1.9)$$

where  $W_n$  is the  $W$ -mapping defined by (2.3) below and  $T$  is a nonexpansive mapping, and introduce an explicit iterative algorithm which converges strongly to a solution  $\tilde{x}$  of the hierarchical problem (1.9).

## 2. Preliminaries

Let  $C$  a nonempty closed convex subset of a real Hilbert space  $H$ . Recall that a mapping  $Q : C \rightarrow C$  is said to be contractive if there exists a constant  $\gamma \in (0, 1)$  such that

$$\|Qx - Qy\| \leq \gamma \|x - y\|, \quad \forall x, y \in C. \quad (2.1)$$

A mapping  $T : C \rightarrow C$  is called nonexpansive if

$$\|Tx - Ty\| \leq \|x - y\|, \quad \forall x, y \in C. \quad (2.2)$$

Forward, we use  $\text{Fix}(T)$  to denote the fixed points set of  $T$ .

Let  $\{T_i\}_{i=1}^{\infty} : C \rightarrow C$  be an infinite family of nonexpansive mappings and  $\{\xi_i\}_{i=1}^{\infty}$  a real number sequence such that  $0 \leq \xi_i \leq 1$  for each  $i \geq 1$ .

For each  $n \geq 1$ , define a mapping  $W_n : C \rightarrow C$  as follows:

$$\begin{aligned} U_{n,n+1} &= I, \\ U_{n,n} &= \xi_n T_n U_{n,n+1} + (1 - \xi_n)I, \\ U_{n,n-1} &= \xi_{n-1} T_{n-1} U_{n,n} + (1 - \xi_{n-1})I, \\ &\dots \\ U_{n,k} &= \xi_k T_k U_{n,k+1} + (1 - \xi_k)I, \\ U_{n,k-1} &= \xi_{k-1} T_{k-1} U_{n,k} + (1 - \xi_{k-1})I, \\ &\dots \\ U_{n,2} &= \xi_2 T_2 U_{n,3} + (1 - \xi_2)I, \\ W_n = U_{n,1} &= \xi_1 T_1 U_{n,2} + (1 - \xi_1)I. \end{aligned} \quad (2.3)$$

Such  $W_n$  is called the  $W$ -mapping generated by  $\{T_i\}_{i=1}^{\infty}$  and  $\{\xi_i\}_{i=1}^{\infty}$ .

**Lemma 2.1** (see [20]). *Let  $C$  be a nonempty closed convex subset of a real Hilbert space  $H$ . Let  $\{T_i\}_{i=1}^{\infty}$  be an infinite family of nonexpansive mappings of  $C$  into itself with  $\bigcap_{n=1}^{\infty} \text{Fix}(T_n) \neq \emptyset$ . Let  $\xi_1, \xi_2, \dots$  be real numbers such that  $0 < \xi_i \leq b < 1$  for each  $i \geq 1$ . Then one has the following results:*

- (1) for any  $x \in C$  and  $k \geq 1$ , the limit  $\lim_{n \rightarrow \infty} U_{n,k}x$  exists;
- (2)  $\text{Fix}(W) = \bigcap_{n=1}^{\infty} \text{Fix}(T_n)$ .

Using Lemma 3.1 in [21], we can define a mapping  $W$  of  $C$  into itself by  $Wx = \lim_{n \rightarrow \infty} W_n x = \lim_{n \rightarrow \infty} U_{n,1}x$  for all  $x \in C$ . Thus we have the following.

**Lemma 2.2** (see [21]). *If  $\{x_n\}$  is a bounded sequence in  $C$ , then one has*

$$\lim_{n \rightarrow \infty} \|Wx_n - W_n x_n\| = 0. \quad (2.4)$$

**Lemma 2.3** (see [22]). *Let  $C$  be a nonempty closed convex of a real Hilbert space  $H$  and  $T : C \rightarrow C$  be nonexpansive mapping. Then  $T$  is demiclosed on  $C$ , that is, if  $x_n \rightharpoonup x \in C$  and  $x_n - Tx_n \rightarrow 0$ , then  $x = Tx$ .*

**Lemma 2.4** (see [23]). *Assume  $\{a_n\}$  is a sequence of nonnegative real numbers such that*

$$a_{n+1} \leq (1 - \gamma_n)a_n + \delta_n\gamma_n + \eta_n, \quad \forall n \geq 1, \quad (2.5)$$

where  $\{\gamma_n\}$  is a sequence in  $(0, 1)$  and  $\{\delta_n\}, \{\eta_n\}$  are two sequences such that

- (i)  $\sum_{n=1}^{\infty} \gamma_n = \infty$ ;
- (ii)  $\limsup_{n \rightarrow \infty} \delta_n \leq 0$  or  $\sum_{n=1}^{\infty} |\delta_n \gamma_n| < \infty$ ;
- (iii)  $\sum_{n=1}^{\infty} |\eta_n| < \infty$ .

Then  $\lim_{n \rightarrow \infty} a_n = 0$ .

### 3. Main Results

In this section, we introduce our algorithm and give its convergence analysis.

*Algorithm 3.1.* Let  $C$  be a nonempty closed convex subset of a real Hilbert space  $H$  and  $\{T_n\}_{n=1}^{\infty}$  be infinite family of nonexpansive mappings of  $C$  into itself. Let  $Q : C \rightarrow C$  be a contraction with coefficient  $\gamma \in [0, 1)$ . For any  $x_0 \in C$ , let  $\{x_n\}$  the sequence generated iteratively by

$$x_{n+1} = \alpha_n W_n x_n + (1 - \alpha_n) T(\beta_n Q x_n + (1 - \beta_n) x_n), \quad \forall n \geq 0, \quad (3.1)$$

where  $\{\alpha_n\}, \{\beta_n\}$  are two real numbers in  $(0, 1)$  and  $W_n$  is the  $W$ -mapping defined by (2.3).

Now, we give the convergence analysis of the algorithm.

**Theorem 3.2.** *Let  $C$  be a nonempty closed convex subset of a real Hilbert space  $H$  and  $\{T_n\}_{n=1}^{\infty}$  be an infinite family of nonexpansive mappings of  $C$  into itself. Let  $Q : C \rightarrow C$  be a contraction with coefficient  $\gamma \in [0, 1)$ . Assume that the set  $\Omega$  of solutions of the hierarchical problem (1.9) is nonempty. Let  $\{\alpha_n\}, \{\beta_n\}$  be two real numbers in  $(0, 1)$  and  $\{x_n\}$  the sequence generated by (3.1). Assume that the sequence  $\{x_n\}$  is bounded and*

- (i)  $\lim_{n \rightarrow \infty} \alpha_n = 0$  and  $\lim_{n \rightarrow \infty} (\beta_n / \alpha_n) = 0$ ;
- (ii)  $\sum_{n=0}^{\infty} \beta_n = \infty$ ;
- (iii)  $\lim_{n \rightarrow \infty} (1/\beta_n) |(1/\alpha_n) - (1/\alpha_{n-1})| = 0$  and  $\lim_{n \rightarrow \infty} (\prod_{i=1}^{n-1} \xi_i / \alpha_n \beta_n) = \lim_{n \rightarrow \infty} (1/\alpha_n) |1 - (\beta_{n-1} / \beta_n)| = 0$ .

Then  $\lim_{n \rightarrow \infty} (\|x_{n+1} - x_n\| / \alpha_n) = 0$  and every weak cluster point of the sequence  $\{x_n\}$  solves the following variational inequality

$$\begin{aligned} \tilde{x} \in \Omega, \\ \langle (I - Q)\tilde{x}, x - \tilde{x} \rangle \geq 0, \quad \forall x \in \Omega. \end{aligned} \quad (3.2)$$

*Proof.* Set  $y_n = \beta_n Qx_n + (1 - \beta_n)x_n$  for each  $n \geq 0$ . Then we have

$$\begin{aligned} y_n - y_{n-1} &= \beta_n Qx_n + (1 - \beta_n)x_n - \beta_{n-1} Qx_{n-1} - (1 - \beta_{n-1})x_{n-1} \\ &= \beta_n(Qx_n - Qx_{n-1}) + (\beta_n - \beta_{n-1})Qx_{n-1} + (1 - \beta_n)(x_n - x_{n-1}) \\ &\quad + (\beta_{n-1} - \beta_n)x_{n-1}. \end{aligned} \quad (3.3)$$

It follows that

$$\begin{aligned} \|y_n - y_{n-1}\| &\leq \gamma\beta_n\|x_n - x_{n-1}\| + (1 - \beta_n)\|x_n - x_{n-1}\| + |\beta_n - \beta_{n-1}|(\|Qx_{n-1}\| + \|x_{n-1}\|) \\ &= [1 - (1 - \gamma)\beta_n]\|x_n - x_{n-1}\| + |\beta_n - \beta_{n-1}|(\|Qx_{n-1}\| + \|x_{n-1}\|). \end{aligned} \quad (3.4)$$

From (3.1), we have

$$\begin{aligned} x_{n+1} - x_n &= \alpha_n W_n x_n + (1 - \alpha_n)Ty_n - \alpha_{n-1} W_{n-1} x_{n-1} - (1 - \alpha_{n-1})Ty_{n-1} \\ &= \alpha_n(W_n x_n - W_{n-1} x_{n-1}) + (\alpha_n - \alpha_{n-1})W_n x_{n-1} + \alpha_{n-1}(W_n x_{n-1} - W_{n-1} x_{n-1}) \\ &\quad + (1 - \alpha_n)(Ty_n - Ty_{n-1}) + (\alpha_{n-1} - \alpha_n)Ty_{n-1}. \end{aligned} \quad (3.5)$$

Then we obtain

$$\begin{aligned} \|x_{n+1} - x_n\| &\leq \alpha_n\|W_n x_n - W_{n-1} x_{n-1}\| + (1 - \alpha_n)\|Ty_n - Ty_{n-1}\| \\ &\quad + |\alpha_n - \alpha_{n-1}|(\|W_n x_{n-1}\| + \|Ty_{n-1}\|) + \alpha_{n-1}\|W_n x_{n-1} - W_{n-1} x_{n-1}\| \\ &\leq \alpha_n\|x_n - x_{n-1}\| + (1 - \alpha_n)\|y_n - y_{n-1}\| + |\alpha_n - \alpha_{n-1}|(\|W_n x_{n-1}\| + \|Ty_{n-1}\|) \\ &\quad + \alpha_{n-1}\|W_n x_{n-1} - W_{n-1} x_{n-1}\|. \end{aligned} \quad (3.6)$$

From (2.3), since  $T_i$  and  $U_{n,i}$  are nonexpansive, we have

$$\begin{aligned} \|W_n x_{n-1} - W_{n-1} x_{n-1}\| &= \|\xi_1 T_1 U_{n,2} x_{n-1} - \xi_1 T_1 U_{n-1,2} x_{n-1}\| \\ &\leq \xi_1 \|U_{n,2} x_{n-1} - U_{n-1,2} x_{n-1}\| \\ &= \xi_1 \|\xi_2 T_2 U_{n,3} x_{n-1} - \xi_2 T_2 U_{n-1,3} x_{n-1}\| \\ &\leq \xi_1 \xi_2 \|U_{n,3} x_{n-1} - U_{n-1,3} x_{n-1}\| \\ &\leq \dots \\ &\leq \xi_1 \xi_2 \dots \xi_{n-1} \|U_{n,n} x_{n-1} - U_{n-1,n} x_{n-1}\| \\ &\leq M_1 \prod_{i=1}^{n-1} \xi_i, \end{aligned} \quad (3.7)$$

where  $M_1$  is a constant such that  $\sup_{n \geq 1} \{\|U_{n,n}x_{n-1} - U_{n-1,n}x_{n-1}\|\} \leq M_1$ . Substituting (3.4) and (3.7) into (3.6), we get

$$\begin{aligned}
\|x_{n+1} - x_n\| &\leq \alpha_n \|x_n - x_{n-1}\| + (1 - \alpha_n) [1 - (1 - \gamma)\beta_n] \|x_n - x_{n-1}\| \\
&\quad + |\beta_n - \beta_{n-1}| (\|Qx_{n-1}\| + \|x_{n-1}\|) \\
&\quad + |\alpha_n - \alpha_{n-1}| (\|W_n x_{n-1}\| + \|Ty_{n-1}\|) + \alpha_{n-1} M_1 \prod_{i=1}^{n-1} \xi_i \\
&= [1 - (1 - \gamma)\beta_n(1 - \alpha_n)] \|x_n - x_{n-1}\| \\
&\quad + |\beta_n - \beta_{n-1}| (\|Qx_{n-1}\| + \|x_{n-1}\|) \\
&\quad + |\alpha_n - \alpha_{n-1}| (\|W_n x_{n-1}\| + \|Ty_{n-1}\|) + \alpha_{n-1} M_1 \prod_{i=1}^{n-1} \xi_i.
\end{aligned} \tag{3.8}$$

Therefore, it follows that

$$\begin{aligned}
\frac{\|x_{n+1} - x_n\|}{\alpha_n} &\leq [1 - (1 - \gamma)\beta_n(1 - \alpha_n)] \frac{\|x_n - x_{n-1}\|}{\alpha_n} \\
&\quad + \frac{|\beta_n - \beta_{n-1}|}{\alpha_n} (\|Qx_{n-1}\| + \|x_{n-1}\|) \\
&\quad + \frac{|\alpha_n - \alpha_{n-1}|}{\alpha_n} (\|W_n x_{n-1}\| + \|Ty_{n-1}\|) + \alpha_{n-1} M_1 \frac{\prod_{i=1}^{n-1} \xi_i}{\alpha_n} \\
&= [1 - (1 - \gamma)\beta_n(1 - \alpha_n)] \frac{\|x_n - x_{n-1}\|}{\alpha_{n-1}} \\
&\quad + [1 - (1 - \gamma)\beta_n(1 - \alpha_n)] \left( \frac{\|x_n - x_{n-1}\|}{\alpha_n} - \frac{\|x_n - x_{n-1}\|}{\alpha_{n-1}} \right) \\
&\quad + \frac{|\beta_n - \beta_{n-1}|}{\alpha_n} (\|Qx_{n-1}\| + \|x_{n-1}\|) \\
&\quad + \frac{|\alpha_n - \alpha_{n-1}|}{\alpha_n} (\|W_n x_{n-1}\| + \|Ty_{n-1}\|) + \alpha_{n-1} M_1 \frac{\prod_{i=1}^{n-1} \xi_i}{\alpha_n} \\
&\leq [1 - (1 - \gamma)\beta_n(1 - \alpha_n)] \frac{\|x_n - x_{n-1}\|}{\alpha_{n-1}} \\
&\quad + \left( \left| \frac{1}{\alpha_n} - \frac{1}{\alpha_{n-1}} \right| + \frac{|\alpha_n - \alpha_{n-1}|}{\alpha_n} + \frac{|\beta_n - \beta_{n-1}|}{\alpha_n} + \frac{\prod_{i=1}^{n-1} \xi_i}{\alpha_n} \right) M
\end{aligned}$$

$$\begin{aligned}
&= [1 - (1 - \gamma)\beta_n(1 - \alpha_n)] \frac{\|x_n - x_{n-1}\|}{\alpha_{n-1}} + (1 - \gamma)\beta_n(1 - \alpha_n) \\
&\times \left\{ \frac{M}{(1 - \gamma)(1 - \alpha_n)} \left( \frac{1}{\beta_n} \left| \frac{1}{\alpha_n} - \frac{1}{\alpha_{n-1}} \right| + \frac{1}{\beta_n} \frac{|\alpha_n - \alpha_{n-1}|}{\alpha_n} \right. \right. \\
&\quad \left. \left. + \frac{1}{\beta_n} \frac{|\beta_n - \beta_{n-1}|}{\alpha_n} + \frac{\prod_{i=1}^{n-1} \xi_i}{\alpha_n \beta_n} \right) \right\}, \tag{3.9}
\end{aligned}$$

where  $M$  is a constant such that

$$\sup_{n \geq 1} \{ M_1, \|x_n - x_{n-1}\|, (\|W_n x_{n-1}\| + \|T y_{n-1}\|), (\|Q x_{n-1}\| + \|x_{n-1}\|) \} \leq M. \tag{3.10}$$

From (iii), we note that  $\lim_{n \rightarrow \infty} (1/\alpha_{n-1})|\alpha_n - \alpha_{n-1}/\beta_n \alpha_n| = 0$ , which implies that

$$\lim_{n \rightarrow \infty} \frac{1}{\beta_n} \frac{|\alpha_n - \alpha_{n-1}|}{\alpha_n} = 0. \tag{3.11}$$

Thus it follows from (iii) and (3.11) that

$$\lim_{n \rightarrow \infty} \left( \frac{1}{\beta_n} \left| \frac{1}{\alpha_n} - \frac{1}{\alpha_{n-1}} \right| + \frac{1}{\beta_n} \frac{|\alpha_n - \alpha_{n-1}|}{\alpha_n} + \frac{1}{\beta_n} \frac{|\beta_n - \beta_{n-1}|}{\alpha_n} + \frac{\prod_{i=1}^{n-1} \xi_i}{\alpha_n \beta_n} \right) = 0. \tag{3.12}$$

Hence, applying Lemma 2.4 to (3.9), we immediately conclude that

$$\lim_{n \rightarrow \infty} \frac{\|x_{n+1} - x_n\|}{\alpha_n} = 0. \tag{3.13}$$

This implies that

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0. \tag{3.14}$$

Thus, from (3.1) and (3.14), we have

$$\lim_{n \rightarrow \infty} \|x_n - T y_n\| = 0. \tag{3.15}$$

At the same time, we note that

$$y_n - x_n = \beta_n(Q x_n - x_n) \longrightarrow 0. \tag{3.16}$$

Hence we get

$$\lim_{n \rightarrow \infty} \|y_n - T y_n\| = 0. \tag{3.17}$$

Since the sequence  $\{x_n\}$  is bounded,  $\{y_n\}$  is also bounded. Thus there exists a subsequence of  $\{y_n\}$ , which is still denoted by  $\{y_n\}$  which converges weakly to a point  $\tilde{x} \in H$ . Therefore,  $\tilde{x} \in \text{Fix}(T)$  by (3.17) and Lemma 2.3. By (3.1), we observe that

$$x_{n+1} - x_n = \alpha_n(W_n x_n - x_n) + (1 - \alpha_n)(T y_n - y_n) + (1 - \alpha_n)\beta_n(Q x_n - x_n), \quad (3.18)$$

that is,

$$\frac{x_n - x_{n+1}}{\alpha_n} = (I - W_n)x_n + \frac{1 - \alpha_n}{\alpha_n}(I - T)y_n + \frac{\beta_n(1 - \alpha_n)}{\alpha_n}(I - Q)x_n. \quad (3.19)$$

Set  $z_n = (x_n - x_{n+1})/\alpha_n$  for each  $n \geq 1$ , that is,

$$z_n = (I - W_n)x_n + \frac{1 - \alpha_n}{\alpha_n}(I - T)y_n + \frac{\beta_n(1 - \alpha_n)}{\alpha_n}(I - Q)x_n. \quad (3.20)$$

Using monotonicity of  $I - T$  and  $I - W_n$ , we derive that, for all  $u \in \text{Fix}(T)$ ,

$$\begin{aligned} & \langle z_n, x_n - u \rangle \\ &= \langle (I - W_n)x_n, x_n - u \rangle + \frac{1 - \alpha_n}{\alpha_n} \langle (I - T)y_n - (I - T)u, y_n - u \rangle \\ & \quad + \frac{1 - \alpha_n}{\alpha_n} \langle (I - T)y_n, x_n - y_n \rangle + \frac{\beta_n(1 - \alpha_n)}{\alpha_n} \langle (I - Q)x_n, x_n - u \rangle \\ & \geq \langle (I - W_n)u, x_n - u \rangle + \frac{\beta_n(1 - \alpha_n)}{\alpha_n} \langle (I - Q)x_n, x_n - u \rangle + \frac{(1 - \alpha_n)\beta_n}{\alpha_n} \langle (I - T)y_n, x_n - Qx_n \rangle \\ &= \langle (I - W)u, x_n - u \rangle + \langle (W - W_n)u, x_n - u \rangle + \frac{\beta_n(1 - \alpha_n)}{\alpha_n} \langle (I - Q)x_n, x_n - u \rangle \\ & \quad + \frac{(1 - \alpha_n)\beta_n}{\alpha_n} \langle (I - T)y_n, x_n - Qx_n \rangle. \end{aligned} \quad (3.21)$$

But, since  $z_n \rightarrow 0$ ,  $\beta_n/\alpha_n \rightarrow 0$  and  $\lim_{n \rightarrow \infty} \|W_n u - W u\| = 0$  (by Lemma 2.2), it follows from the above inequality that

$$\limsup_{n \rightarrow \infty} \langle (I - W)u, x_n - u \rangle \leq 0, \quad \forall u \in \text{Fix}(T). \quad (3.22)$$

This suffices to guarantee that  $\omega_w(x_n) \subset \Omega$ . As a matter of fact, if we take any  $x^* \in \omega_w(x_n)$ , then there exists a subsequence  $\{x_{n_j}\}$  of  $\{x_n\}$  such that  $x_{n_j} \rightharpoonup x^*$ . Therefore, we have

$$\langle (I - W)u, x^* - u \rangle = \lim_{j \rightarrow \infty} \langle (I - W)u, x_{n_j} - u \rangle \leq 0, \quad \forall u \in \text{Fix}(T). \quad (3.23)$$

Note that  $x^* \in \text{Fix}(T)$ . Hence  $x^*$  solves the following problem:

$$\begin{aligned} x^* &\in \text{Fix}(T), \\ \langle (I - W)u, x^* - u \rangle &\leq 0, \quad \forall u \in \text{Fix}(T). \end{aligned} \quad (3.24)$$

It is obvious that this is equivalent to the problem (1.9) since  $W_n \rightarrow W$  uniformly in any bounded set (by Lemma 2.2). Thus  $x^* \in \Omega$ .

Let  $\tilde{x}$  be the unique solution of the variational inequality (3.2). Now, take a subsequence  $\{x_{n_i}\}$  of  $\{x_n\}$  such that

$$\limsup_{n \rightarrow \infty} \langle (I - Q)\tilde{x}, x_n - \tilde{x} \rangle = \lim_{i \rightarrow \infty} \langle (I - Q)\tilde{x}, x_{n_i} - \tilde{x} \rangle. \quad (3.25)$$

Without loss of generality, we may further assume that  $x_{n_i} \rightarrow \bar{x}$ . Then  $\bar{x} \in \Omega$ . Therefore, we have

$$\limsup_{n \rightarrow \infty} \langle (I - Q)\tilde{x}, x_n - \tilde{x} \rangle = \langle (I - Q)\tilde{x}, \bar{x} - \tilde{x} \rangle \geq 0. \quad (3.26)$$

This completes the proof.  $\square$

**Theorem 3.3.** *Let  $C$  be a nonempty closed convex subset of a real Hilbert space  $H$ . Let  $\{T_n\}_{n=1}^{\infty}$  be infinite family of nonexpansive mappings of  $C$  into itself. Let  $Q : C \rightarrow C$  be a contraction with coefficient  $\gamma \in [0, 1)$ . Assume that the set  $\Omega$  of solutions of the hierarchical problem (1.9) is nonempty. Let  $\{\alpha_n\}, \{\beta_n\}$  be two real numbers in  $(0, 1)$  and  $\{x_n\}$  the sequence generated by (3.1). Assume that the sequence  $\{x_n\}$  is bounded and*

- (i)  $\lim_{n \rightarrow \infty} \alpha_n = 0$ ,  $\lim_{n \rightarrow \infty} \beta_n / \alpha_n = 0$  and  $\lim_{n \rightarrow \infty} \alpha_n^2 / \beta_n = 0$ ;
- (ii)  $\sum_{n=0}^{\infty} \beta_n = \infty$ ;
- (iii)  $\lim_{n \rightarrow \infty} (1/\beta_n)|(1/\alpha_n) - (1/\alpha_{n-1})| = 0$  and  $\lim_{n \rightarrow \infty} \prod_{i=1}^{n-1} \xi_i / \alpha_n \beta_n = \lim_{n \rightarrow \infty} (1/\alpha_n)|1 - (\beta_{n-1}/\beta_n)| = 0$ ;
- (iv) *there exists a constant  $k > 0$  such that  $\|x - Tx\| \geq k \text{Dist}(x, \text{Fix}(T))$ , where*

$$\text{Dist}(x, \text{Fix}(T)) = \inf_{y \in \text{Fix}(T)} \|x - y\|. \quad (3.27)$$

*Then the sequence  $\{x_n\}$  defined by (3.1) converges strongly to a point  $\tilde{x} \in \text{Fix}(T)$ , which solves the variational inequality problem (3.2).*

*Proof.* From (3.1), we have

$$x_{n+1} - \tilde{x} = \alpha_n(W_n x_n - W_n \tilde{x}) + \alpha_n(W_n \tilde{x} - \tilde{x}) + (1 - \alpha_n)(T y_n - \tilde{x}). \quad (3.28)$$

Thus we have

$$\begin{aligned}
\|x_{n+1} - \tilde{x}\|^2 &\leq \|\alpha_n(W_n x_n - W_n \tilde{x}) + (1 - \alpha_n)(T y_n - \tilde{x})\|^2 + 2\alpha_n \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle \\
&\leq (1 - \alpha_n) \|T y_n - \tilde{x}\|^2 + \alpha_n \|W_n x_n - W_n \tilde{x}\|^2 + 2\alpha_n \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle \quad (3.29) \\
&\leq (1 - \alpha_n) \|y_n - \tilde{x}\|^2 + \alpha_n \|x_n - \tilde{x}\|^2 + 2\alpha_n \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle.
\end{aligned}$$

At the same time, we observe that

$$\begin{aligned}
\|y_n - \tilde{x}\|^2 &= \|(1 - \beta_n)(x_n - \tilde{x}) + \beta_n(Qx_n - Q\tilde{x}) + \beta_n(Q\tilde{x} - \tilde{x})\|^2 \\
&\leq \|(1 - \beta_n)(x_n - \tilde{x}) + \beta_n(Qx_n - Q\tilde{x})\|^2 + 2\beta_n \langle Q\tilde{x} - \tilde{x}, y_n - \tilde{x} \rangle \\
&\leq (1 - \beta_n) \|x_n - \tilde{x}\|^2 + \beta_n \|Qx_n - Q\tilde{x}\|^2 + 2\beta_n \langle Q\tilde{x} - \tilde{x}, y_n - \tilde{x} \rangle \quad (3.30) \\
&\leq (1 - \beta_n) \|x_n - \tilde{x}\|^2 + \beta_n \gamma^2 \|x_n - \tilde{x}\|^2 + 2\beta_n \langle Q\tilde{x} - \tilde{x}, y_n - \tilde{x} \rangle \\
&= \left[1 - (1 - \gamma^2)\beta_n\right] \|x_n - \tilde{x}\|^2 + 2\beta_n \langle Q\tilde{x} - \tilde{x}, y_n - \tilde{x} \rangle.
\end{aligned}$$

Substituting (3.30) into (3.29), we get

$$\begin{aligned}
\|x_{n+1} - \tilde{x}\|^2 &\leq \alpha_n \|x_n - \tilde{x}\|^2 + (1 - \alpha_n) \left[1 - (1 - \gamma^2)\beta_n\right] \|x_n - \tilde{x}\|^2 \\
&\quad + 2\beta_n(1 - \alpha_n) \langle Q\tilde{x} - \tilde{x}, y_n - \tilde{x} \rangle + 2\alpha_n \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle \\
&= \left[1 - (1 - \gamma^2)\beta_n(1 - \alpha_n)\right] \|x_n - \tilde{x}\|^2 + 2\beta_n(1 - \alpha_n) \langle Q\tilde{x} - \tilde{x}, y_n - \tilde{x} \rangle \\
&\quad + 2\alpha_n \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle \\
&= \left[1 - (1 - \gamma^2)\beta_n(1 - \alpha_n)\right] \|x_n - \tilde{x}\|^2 + (1 - \gamma^2)\beta_n(1 - \alpha_n) \\
&\quad \times \left\{ \frac{2}{1 - \gamma^2} \langle Q\tilde{x} - \tilde{x}, y_n - \tilde{x} \rangle + \frac{2}{(1 - \gamma^2)(1 - \alpha_n)} \times \frac{\alpha_n}{\beta_n} \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle \right\}. \quad (3.31)
\end{aligned}$$

By Theorem 3.2, we note that every weak cluster point of the sequence  $\{x_n\}$  is in  $\Omega$ . Since  $y_n - x_n \rightarrow 0$ , then every weak cluster point of  $\{y_n\}$  is also in  $\Omega$ . Consequently, since  $\tilde{x} = \text{proj}_\Omega(Q\tilde{x})$ , we easily have

$$\limsup_{n \rightarrow \infty} \langle Q\tilde{x} - \tilde{x}, y_n - \tilde{x} \rangle \leq 0. \quad (3.32)$$

On the other hand, we observe that

$$\langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle = \langle W_n \tilde{x} - \tilde{x}, \text{proj}_{\text{Fix}(T)} x_{n+1} - \tilde{x} \rangle + \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \text{proj}_{\text{Fix}(T)} x_{n+1} \rangle. \quad (3.33)$$

Since  $\tilde{x}$  is a solution of the problem (1.9) and  $\text{proj}_{\text{Fix}(T)} x_{n+1} \in \text{Fix}(T)$ , we have

$$\langle W_n \tilde{x} - \tilde{x}, \text{proj}_{\text{Fix}(T)} x_{n+1} - \tilde{x} \rangle \leq 0. \quad (3.34)$$

Thus it follows that

$$\begin{aligned} \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle &\leq \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \text{proj}_{\text{Fix}(T)} x_{n+1} \rangle \\ &\leq \|W_n \tilde{x} - \tilde{x}\| \|x_{n+1} - \text{proj}_{\text{Fix}(T)} x_{n+1}\| \\ &= \|W_n \tilde{x} - \tilde{x}\| \times \text{Dist}(x_{n+1}, \text{Fix}(T)) \\ &\leq \frac{1}{k} \|W_n \tilde{x} - \tilde{x}\| \|x_{n+1} - Tx_{n+1}\|. \end{aligned} \quad (3.35)$$

We note that

$$\begin{aligned} \|x_{n+1} - Tx_{n+1}\| &\leq \|x_{n+1} - Tx_n\| + \|Tx_n - Tx_{n+1}\| \\ &\leq \alpha_n \|W_n x_n - Tx_n\| + (1 - \alpha_n) \|Ty_n - Tx_n\| + \|x_{n+1} - x_n\| \\ &\leq \alpha_n \|W_n x_n - Tx_n\| + \|y_n - x_n\| + \|x_{n+1} - x_n\| \\ &\leq \alpha_n \|W_n x_n - Tx_n\| + \beta_n \|Qx_n - x_n\| + \|x_{n+1} - x_n\|. \end{aligned} \quad (3.36)$$

Hence we have

$$\begin{aligned} &\frac{\alpha_n}{\beta_n} \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle \\ &\leq \frac{\alpha_n^2}{\beta_n} \left( \frac{1}{k} \|W_n \tilde{x} - \tilde{x}\| \|W_n x_n - Tx_n\| \right) + \alpha_n \left( \frac{1}{k} \|W_n \tilde{x} - \tilde{x}\| \|Qx_n - x_n\| \right) \\ &\quad + \frac{\alpha_n^2}{\beta_n} \frac{\|x_{n+1} - x_n\|}{\alpha_n} \left( \frac{1}{k} \|W_n \tilde{x} - \tilde{x}\| \right). \end{aligned} \quad (3.37)$$

From Theorem 3.2, we have  $\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\|/\alpha_n = 0$ . At the same time, we note that  $\{(1/k)\|W_n \tilde{x} - \tilde{x}\|\|W_n x_n - Tx_n\|\}$ ,  $\{(1/k)\|W_n \tilde{x} - \tilde{x}\|\|Qx_n - x_n\|\}$ , and  $\{(1/k)\|W_n \tilde{x} - \tilde{x}\|\}$  are all bounded. Hence it follows from (i) and the above inequality that

$$\limsup_{n \rightarrow \infty} \frac{\alpha_n}{\beta_n} \langle W_n \tilde{x} - \tilde{x}, x_{n+1} - \tilde{x} \rangle \leq 0. \quad (3.38)$$

Finally, by (3.31)–(3.38) and Lemma 2.4, we conclude that the sequence  $\{x_n\}$  converges strongly to a point  $\tilde{x} \in \text{Fix}(T)$ . This completes the proof.  $\square$

*Remark 3.4.* In the present paper, we consider the hierarchical problem (1.9) which includes the hierarchical problem (1.1) as a special case.

From the above discussion, we can easily deduce the following result.

*Algorithm 3.5.* Let  $C$  be a nonempty closed convex subset of a real Hilbert space  $H$  and  $S$  a nonexpansive mapping of  $C$  into itself. Let  $Q : C \rightarrow C$  be a contraction with coefficient  $\gamma \in [0, 1)$ . For any  $x_0 \in C$ , let  $\{x_n\}$  the sequence generated iteratively by

$$x_{n+1} = \alpha_n Sx_n + (1 - \alpha_n)T(\beta_n Qx_n + (1 - \beta_n)x_n), \quad \forall n \geq 0, \quad (3.39)$$

where  $\{\alpha_n\}, \{\beta_n\}$  are two real numbers in  $(0, 1)$ .

**Corollary 3.6.** *Let  $C$  be a nonempty closed convex subset of a real Hilbert space  $H$ . Let  $S : C \rightarrow C$  be a nonexpansive mapping. Let  $Q : C \rightarrow C$  be a contraction with coefficient  $\gamma \in [0, 1)$ . Assume that the set  $\Omega'$  of solutions of the hierarchical problem (1.1) is nonempty. Let  $\{\alpha_n\}, \{\beta_n\}$  be two real numbers in  $(0, 1)$  and  $\{x_n\}$  the sequence generated by (3.1). Assume that the sequence  $\{x_n\}$  is bounded and*

- (i)  $\lim_{n \rightarrow \infty} \alpha_n = 0$ ,  $\lim_{n \rightarrow \infty} \beta_n / \alpha_n = 0$  and  $\lim_{n \rightarrow \infty} \alpha_n^2 / \beta_n = 0$ ;
- (ii)  $\sum_{n=0}^{\infty} \beta_n = \infty$ ;
- (iii)  $\lim_{n \rightarrow \infty} (1/\beta_n)|(1/\alpha_n) - (1/\alpha_{n-1})| = 0$  and  $\lim_{n \rightarrow \infty} (1/\alpha_n)|1 - (\beta_{n-1}/\beta_n)| = 0$ ;
- (iv) there exists a constant  $k > 0$  such that  $\|x - Tx\| \geq k \text{Dist}(x, \text{Fix}(T))$ , where

$$\text{Dist}(x, \text{Fix}(T)) = \inf_{y \in \text{Fix}(T)} \|x - y\|. \quad (3.40)$$

Then the sequence  $\{x_n\}$  defined by (3.39) converges strongly to a point  $\tilde{x} \in \text{Fix}(T)$ , which solves the hierarchical problem (1.1).
