# ON THE PERIODIC MILD SOLUTIONS TO COMPLETE HIGHER ORDER DIFFERENTIAL EQUATIONS ON BANACH SPACES 

Lan Nguyen

Abstract. For the complete higher order differential equation

$$
u^{(n)}(t)=\sum_{k=0}^{n-1} A_{k} u^{(k)}(t)+f(t), \quad 0 \leq t \leq T
$$

on a Banach space $E$, we give necessary and sufficient conditions for the periodicity of mild solutions. The results, which are proved in a simple manner, generalize some well-known ones.

## 1 Introduction

In this paper we are concerned with the periodicity of solutions of the complete higher order differential equation:

$$
\begin{equation*}
u^{(n)}(t)=\sum_{j=0}^{n-1} A_{j} u^{(j)}(t)+f(t), \quad 0 \leq t \leq T, \tag{1.1}
\end{equation*}
$$

where $A_{j}$ are linear, closed operators on a Banach space $E$ and $f$ is a function from $[0, T]$ to $E$.
The asymptotic behavior and, in particular, the periodicity of solutions of the higher order differential equation

$$
\begin{equation*}
u^{(n)}(t)=A u(t)+f(t), \quad 0 \leq t \leq T \tag{1.2}
\end{equation*}
$$

has been an subject of intensive study for recent decades. When $n=1$, it is wellknown [7] that, if $A$ is an $n \times n$ matrix on $C^{n}$, then (1.2) admits a unique $T$-periodic solution for each continuous $T$-periodic forcing term $f$ if and only if $\lambda_{k}=2 k \pi t / T$, $k \in Z$, are not eigen-values of $A$. That result was extended by Krein and Dalecki [4] to the Cauchy problem in an abstract Banach space. It was claimed [4, Theorem

[^0]http://www.utgjiu.ro/math/sma

II 4.3] that, if $A$ is a linear, bounded operator on $E$, then (1.2) admits a unique $T$ periodic solution for each $f \in C[0, T]$ if and only if $2 k \pi i / T \in \varrho(A), k \in Z$. Here $\varrho(A)$ denotes the resolvent set of $A$. For unbounded operator $A$, the situation changes dramatically and the above statement generally fails. When $A$ generates a strongly continuous semigroup, periodicity of solutions of (1.2) has intensively been studied recently (see e.g. $[9,10,14,15]$ ). Corresponding results on the periodic solutions of the second order differential equation were obtained in $[3,17]$, when $A$ is generator of a cosine family. Related results on the periodicity of solutions of (1.2), when $A$ is a closed operator, can be found in $[5,8,12,13,16]$ and the references therein.

Unfortunately, for the complete higher differential equations, we have little consideration about the regularity of their solutions, mainly because of the complexity of the structure of the equation. In this paper we investigate the periodicity of mild solutions of the complete higher order differential equation (1.1) when $A_{j}, j=$ $0,1, \ldots, n-1$, are linear, closed operators. The main tool we use here is the Fourier series method. For an integrable function $f(t)$ from $[0, T]$ to $E$, the Fourier coefficient of $f(t)$ is defined as

$$
f_{k}=\frac{1}{T} \int_{0}^{T} f(s) e^{-2 k \pi i s / T} d s, k \in Z
$$

Then $f(t)$ can be represented by Fourier series

$$
f(t) \approx \sum_{k=-\infty}^{\infty} e^{2 k \pi i t / T} f_{k}
$$

First, we give a general definition of mild solution to the complete higher order differential equation (1.1). This definition is an extension of that introduced in [2, 13], when the equation has the form of (1.2). We then establish the relationship between the Fourier coefficients of the periodic solutions of (1.1) and those of the inhomogeneity $f$. As the main result, we give different equivalent conditions so that (1.1) admits a unique periodic solution for each inhomogeneity $f$ in a certain function space. Our result generalizes some well-known ones, as in Section 3 we present several particular cases, among which, $A$ generates a $C_{0}$ semigroup and a cosine family.

Let us fix some notations. A continuous function on $[0, T]$ is said to be $T$-periodic if $u(0)=u(T)$. For the sake of simplicity (and without loss of generality) we assume $T=1$ and put $J:=[0,1]$. For $p \geq 1, L_{p}(J)$ denotes the space of $E$-valued integrable functions on $J$ with $\|f\|_{L_{p}(J)}=\int_{0}^{1}\|f(t)\|^{p} d t<\infty$ and $C(J)$ the space of continuous functions on $J$ with and $\|f\|_{C(J)}=\sup _{J}\|f(t)\|<\infty$. Moreover, for $m>0$ we define the following function spaces:

1) $W_{p}^{m}(J):=\left\{f \in L_{p}(J): f^{\prime}, f^{\prime \prime}, \ldots, f^{(m)} \in L_{p}(J)\right\} . W_{p}^{m}(J)$ is then a Banach space
with the norm

$$
\|f\|_{W_{p}^{m}}:=\sum_{j=0}^{m}\left\|f^{(j)}\right\|_{L_{p}(J)}
$$

2) $P^{m}(J):=\left\{f \in C(J): f, f^{\prime}, \ldots, f^{(m)}\right.$ are in $\left.P(J)\right\}$. That means $P^{m}(J)$ is the space of all functions on $J$, which can be extended to 1-periodic, $m$-times continuously differentiable functions on $R . P^{m}(J)$ is a Banach space with the norm

$$
\|f\|_{P^{m}(J)}:=\sum_{j=0}^{m}\left\|f^{(j)}\right\|_{C(J)}
$$

3) $W P_{p}^{m}(J):=P^{m-1}(J) \cap W_{p}^{m}(J)$. It is easy to see that $W P_{p}^{m}(J)$ is a Banach space with $W_{p}^{m}(J)$-norm.
We will use the following simple lemma.
Lemma 1. If $F$ is a continuous function on $J$ such that $f=F^{\prime} \in L_{p}(J)$, then for $k \neq 0$ we have

$$
F_{k}=\frac{1}{2 k \pi i} f_{k}+\frac{F(0)-F(1)}{2 k \pi i}
$$

where $f_{k}$ and $F_{k}$ are the Fourier series of $f$ and $F$, respectively.
Throughout this paper, if not otherwise indicated, we assume that $A_{i}, i=$ $0,1, \ldots, n-1$, are linear, closed and densely defined operators on $E$ with $\cap_{j=0}^{n-1} D\left(A_{j}\right)$ dense in $E$, that satisfy the following condition:

Condition F: There exists a linear, closed operator $B$ on $E$ with $0 \in \varrho(B)$ such that $B^{-1} A_{j}$ can be extended to bounded operators $B_{j}=\overline{B^{-1} A_{j}}$ for all $j=0,1, \ldots, n-1$. For a number $\lambda \in C$, define the operator $S(\lambda)$ by

$$
\begin{aligned}
S(\lambda) & :=\lambda^{n}-B\left(\sum_{j=0}^{n-1} \lambda^{j} \overline{B^{-1} A_{j}}\right) \\
& =\lambda^{n}-B\left(\sum_{j=0}^{n-1} \lambda^{j} B_{j}\right)
\end{aligned}
$$

with

$$
D(S(\lambda))=\left\{x \in E: \sum_{j=0}^{n-1} \lambda^{j} B_{j} x \in D(B)\right\} .
$$

It is not hard to see that $\cap_{j=0}^{n-1} D\left(A_{J}\right) \subseteq D\left(S(\lambda)\right.$. Moreover, since $B^{-1} S(\lambda)$ are bounded, $S(\lambda)$ are closed operators. Finally, we define the resolvent $\varrho(S)$ by

$$
\varrho(S):=\{\lambda \in C: S(\lambda) \text { is injective and surjective }\}
$$

and the spectrum $\sigma(S):=C \backslash \varrho(S)$. Since $S(\lambda)$ are closed operators, if $\lambda \in \varrho(S)$, then $S(\lambda)^{-1}$ is a bounded operator on $E$.

## 2 Periodic Mild Solutions of Higher Order Differential Equations

Let $F$ be either $L_{p}(J)$ or $C(J)$ space. We define the operator $I: F \rightarrow C(J)$ by $I f(t):=\int_{0}^{t} f(s) d s$ and $I^{j} f:=I\left(I^{j-1} f\right)$.

Definition 2. (1) Suppose $f \in L_{p}(J)$. A continuous function $u$ is called a mild solution of (1.1) on $J$, if $\sum_{j=0}^{n-1} B_{j} I^{n-j} u(t) \in D(B)$ and there are vector $x_{0}$, $x_{1}, \ldots, x_{n-1}$ in $E$ such that

$$
\begin{equation*}
u(t)=\sum_{j=0}^{n-1} \frac{t^{i}}{j!} x_{j}+B\left(\sum_{j=0}^{n-1} B_{j} I^{n-j} u(t)\right)+I^{n} f(t) \tag{2.1}
\end{equation*}
$$

for all $t \in J$.
(2) Suppose $f$ is a continuous function on $J$. A function $u$ is a classical solution of (1.1) on $J$, if $u$ is $n$-times continuously differentiable, $\sum_{j=0}^{n-1} B_{j} u^{(j)} u(t) \in D(B)$ and

$$
u^{(n)}(t)=B\left(\sum_{j=0}^{n-1} B_{j} u^{(j)}(t)\right)+f(t)
$$

holds for $t \in J$.
The mild solution to (1.1) defined by (2.1) is really an extension of classical solution in the sense that every classical solution is a mild solution and conversely, if a mild solution is $n$-times continuously differentiable, then it is a classical solution. That statement is actually contained in the following lemma. For the sake of simplicity, for $j<0$, we denote $I^{j} u(t):=u^{(j)}(t)$.

Lemma 3. Suppose $0 \leq m \leq n$ and $u$ is a mild solution of (1.1), which is m-times continuously differentiable. Then we have $\sum_{j=0}^{n-1} B_{j} I^{n-m-j} u(t) \in D(B)$ and

$$
\begin{equation*}
u^{(m)}(t)=\sum_{j=m}^{n-1} \frac{t^{j-m}}{(j-m)!} x_{j}+B\left(\sum_{j=0}^{n-1} B_{j} I^{n-m-j} u(t)\right)+I^{n-m} f(t) \tag{2.2}
\end{equation*}
$$

Proof. If $m=0$, then (2.2) coincides with (2.1). We prove for $m=1$ : Let

$$
v(t):=B\left(\sum_{j=0}^{n-1} B_{j} I^{n-j} u(t)\right)=u(t)-\sum_{j=0}^{n-1} \frac{t^{j}}{j!} x_{j}-I^{n} f(t)
$$

Then, by the assumptions, $v$ is continuously differentiable and

$$
v^{\prime}(t)=u^{\prime}(t)-\sum_{j=1}^{n-1} \frac{t^{j-1}}{(j-1)!} x_{j}-I^{n-1} f(t)
$$

Let $h>0$ and put

$$
v_{h}:=\sum_{j=0}^{n-1} B_{j} \frac{1}{h} \int_{t}^{t+h} I^{n-j-1} u(s) d s
$$

Then $v_{h} \rightarrow \sum_{j=0}^{n-1} B_{j}\left(I^{n-j-1} u\right)(t)$ for $h \rightarrow 0$ and

$$
\begin{aligned}
B v_{h} & =B \sum_{j=0}^{n-1} \frac{1}{h}\left(B_{j} \int_{0}^{t+h} I^{n-j-1} u(s) d s-B_{j} \int_{0}^{t} I^{n-j-1} u(s) d s\right) \\
& =\frac{1}{h} B \sum_{j=0}^{n-1} B_{j} \int_{0}^{t+h} I^{n-j-1} u(s) d s-\frac{1}{h} B \sum_{j=0}^{n-1} B_{j} \int_{0}^{t} I^{n-j-1} u(s) d s \\
& =\frac{1}{h}(v(t+h)-v(t)) \\
& \rightarrow v^{\prime}(t) \text { for } h \rightarrow 0 .
\end{aligned}
$$

Since $B$ is a closed operator, we obtain that $\sum_{j=0}^{n-1} B_{j}\left(I^{n-j-1} u\right)(t) \in D(B)$ and

$$
B \sum_{j=0}^{n-1} B_{j}\left(I^{n-j-1} u\right)(t)=u^{\prime}(t)-\sum_{j=1}^{n-1} \frac{t^{j-1}}{(j-1)!} x_{j}-I^{n-1} f(t),
$$

from which (2.2) with $m=1$ follows. If $m>1$, we obtain (2.2) by repeating the above process $(m-1)$ times.
In particular, if $f$ is continuous and the mild solution $u$ is $n$-times continuously differentiable, i.e. $m=n$, then (2.2) becomes $u^{(n)}(t)=B \sum_{j=0}^{n-1} B_{j} I^{-j} u(t)+f(t)=$ $B \sum_{j=0}^{n-1} B_{j} u^{(j)}(t)+f(t)$, i.e. $u$ is a classical solution of (1.1).
We now consider the mild solutions which are ( $n-1$ ) times continuously differentiable. The following proposition describes the connection between the Fourier coefficients of those solutions and those of $f(t)$. Before stating the proposition, we define the bounded operator on $E$ :

$$
S^{\prime}(\lambda):=\lambda^{n} B^{-1}-\sum_{j=0}^{n-1} \lambda^{j} B_{j} .
$$

It is not hard to see that $S^{\prime}(\lambda)$ is the bounded extension of $B^{-1} S(\lambda)$.
Proposition 4. Suppose $f \in L_{p}(J)$ and $u$ is a mild solution of (1.1), which is ( $n-1$ ) times continuously differentiable. Then

$$
\begin{equation*}
S^{\prime}(2 k \pi i) u_{k}-B^{-1} f_{k}=\sum_{j=0}^{n-1}\left((2 k \pi i)^{n-j-1} B^{-1}-\sum_{m=j+1}^{n-1}(2 k \pi i)^{m-j-1} B_{m}\right)\left[u^{(j)}(0)-u^{(j)}(1)\right] \tag{2.3}
\end{equation*}
$$

for $k \in Z$.

Proof. Denote $x_{m}:=u^{(m)}(0)-u^{(m)}(1)$. Let $u_{k}^{(m)}$ be the $k^{t h}$ Fourier coefficient of $u^{(m)}$. Using the identity

$$
\begin{equation*}
u_{k}^{(m)}=\left[u^{(m-1)}(1)-u^{(m-1)}(0)\right]+(2 k \pi i) u_{k}^{(m-1)}=-x_{m-1}+(2 k \pi i) u_{k}^{(m-1)} \tag{2.4}
\end{equation*}
$$

for $m=0,1,2, \ldots, n-1$ (by Lemma 1 ), we obtain

$$
\begin{equation*}
u_{k}^{(m)}=-\sum_{j=0}^{m-1}(2 k \pi i)^{m-j-1} x_{j}+(2 k \pi i)^{m} u_{k} \tag{2.5}
\end{equation*}
$$

Let $u$ now be a mild solution of (1.1), which is $(n-1)$ times continuously differentiable. By Lemma 3, it satisfies the following identity

$$
\begin{equation*}
u^{(n-1)}(t)=u^{(n-1)}(0)+B\left(\sum_{m=1}^{n-1} B_{m} u^{(m-1)}(t)+B_{0} \int_{0}^{t} u(s) d s\right)+\int_{0}^{t} f(s) d s \tag{2.6}
\end{equation*}
$$

First, if $k=0$, then using (2.6) with $t=0$ and $t=1$ we have

$$
0=\sum_{m=1}^{n-1} B_{m} u^{(m-1)}(0)
$$

and

$$
-x_{n-1}=B\left(\sum_{m=1}^{n-1} B_{m} u^{(m-1)}(1)+B_{0} u_{0}\right)+f_{0}
$$

from which we have

$$
\begin{align*}
-B^{-1} x_{n-1}-B^{-1} f_{0} & =\sum_{m=1}^{n-1} B_{m} u^{(m-1)}(1)+B_{0} u_{0} \\
& =-\sum_{m=1}^{n-1} B_{m} x_{m-1}+B_{0} u_{0} \tag{2.7}
\end{align*}
$$

which means that (2.3) holds for $k=0$.
Next, if $k \neq 0$, taking the $k^{\text {th }}$ Fourier coefficient on both sides of (2.6), we obtain

$$
\begin{aligned}
u_{k}^{(n-1)} & =B\left(\sum_{m=1}^{n-1} B_{m} u_{k}^{(m-1)}+B_{0} \int_{0}^{1} e^{-2 k \pi i s} \int_{0}^{s} u(\tau) d \tau d s\right)+\int_{0}^{1} e^{-2 k \pi i s} \int_{0}^{s} f(\tau) d \tau d s \\
& =B\left(\sum_{m=1}^{n-1} B_{m} u_{k}^{(m-1)}+\frac{B_{0} u_{k}-B_{0} u_{0}}{2 k \pi i}\right)+\frac{f_{k}-f_{0}}{2 k \pi i}
\end{aligned}
$$

Surveys in Mathematics and its Applications 6 (2011), $23-41$
http://www.utgjiu.ro/math/sma
from which we obtain

$$
\begin{equation*}
\sum_{m=1}^{n-1} B_{m} u_{k}^{(m-1)}+\frac{B_{0} u_{k}-B_{0} u_{0}}{2 k \pi i}=B^{-1} u_{k}^{(n-1)}+\frac{B^{-1} f_{0}-B^{-1} f_{k}}{2 k \pi i} \tag{2.8}
\end{equation*}
$$

Here we used Lemma 1 for $F(t)=\int_{0}^{t} u(\tau) d \tau d s$ and $F(t)=\int_{0}^{t} f(\tau) d \tau d s$. Using (2.5) for both sides of (2.8) we have

$$
\begin{gathered}
\sum_{m=1}^{n-1} \quad B_{m}\left(\sum_{j=0}^{m-2}-(2 k \pi i)^{m-j-2} x_{j}+\left((2 k \pi i)^{m-1} u_{k}\right)+\frac{B_{0} u_{k}-B_{0} u_{0}}{2 k \pi i}\right. \\
=\quad B^{-1}\left(\sum_{j=0}^{n-2}-(2 k \pi i)^{n-j-2} x_{j}+(2 k \pi i)^{n-1} u_{k}\right)+\frac{B^{-1} f_{0}-B^{-1} f_{k}}{2 k \pi i}
\end{gathered}
$$

from which it implies

$$
\begin{align*}
& S^{\prime}(2 k \pi) u_{k}-B^{-1} f_{k}= \\
= & \sum_{j=0}^{n-2}(2 k \pi i)^{n-j-1} B^{-1} x_{j}-\sum_{m=1}^{n-1} B_{m}\left(\sum_{j=0}^{m-2}(2 k \pi i)^{m-j-1} x_{j}\right)-\left(B_{0} u_{0}+B^{-1} f_{0}\right) \tag{2.9}
\end{align*}
$$

Using Identity (2.7) for (2.9) we have

$$
\begin{aligned}
& S^{\prime}(2 k \pi) u_{k}-B^{-1} f_{k}= \\
= & \sum_{j=0}^{n-2}(2 k \pi i)^{n-j-1} B^{-1} x_{j}-\sum_{m=1}^{n-1} B_{m}\left(\sum_{j=0}^{m-2}(2 k \pi i)^{m-j-1} x_{j}\right)-\left(-B^{-1} x_{n-1}+\sum_{m=1}^{n-1} B_{m} x_{m-1}\right) \\
= & B^{-1} x_{n-1}+\sum_{j=0}^{n-2}(2 k \pi i)^{n-j-1} B^{-1} x_{j}-\sum_{m=1}^{n-1} B_{m}\left(\sum_{j=0}^{m-2}(2 k \pi i)^{m-j-1} x_{j}+x_{m-1}\right) \\
= & B^{-1} x_{n-1}+\sum_{j=0}^{n-2}(2 k \pi i)^{n-j-1} B^{-1} x_{j}-\sum_{m=1}^{n-1} \sum_{j=0}^{m-1}(2 k \pi i)^{m-j-1} B_{m} x_{j} \\
= & \sum_{j=0}^{n-1}(2 k \pi i)^{n-j-1} x_{j}-\sum_{j=0}^{n-2} \sum_{m=j+1}^{n-1}(2 k \pi i)^{m-j-1} A_{m} x_{j} \\
= & B^{-1} x_{n-1}+\sum_{j=0}^{n-2}\left((2 k \pi i)^{n-j-1} B^{-1}-\sum_{m=j+1}^{n-1}(2 k \pi i)^{m-j-1} B_{m}\right) x_{j} \\
= & \sum_{j=0}^{n-1}\left((2 k \pi i)^{n-j-1} B^{-1}-\sum_{m=j+1}^{n-1}(2 k \pi i)^{m-j-1} B_{m}\right) x_{j},
\end{aligned}
$$

Surveys in Mathematics and its Applications 6 (2011), $23-41$
http://www.utgjiu.ro/math/sma
from which (2.3) follows.
The interesting point of Proposition 4 is that the Fourier coefficients of the mild solution $u$ depend not only on $u$ but also on its derivatives. If $u$ is a periodic solution, then we have a nice relationship between Fourier coefficients of $u$ and those of $f$, as the following proposition shows.

Proposition 5. Suppose $f \in L_{p}(J)$ and $u$ is a mild solution of (1.1), which is $(n-1)$ times continuously differentiable. Then $u$ is 1-periodic if and only if

$$
\begin{equation*}
S(2 k \pi i) u_{k}=f_{k} \tag{2.10}
\end{equation*}
$$

for every $k \in Z$.

First we prove the following lemma.

Lemma 6. Suppose $x_{0}, x_{1}, \ldots, x_{n-1}$ are $n$ vectors in $E$. Then, from the identities

$$
\begin{equation*}
\sum_{j=0}^{n-1}\left((2 k \pi i)^{n-j-1} B^{-1}-\sum_{m=j+1}^{n-1}(2 k \pi i)^{m-j-1} B_{m}\right) x_{j}=0 \tag{2.11}
\end{equation*}
$$

for all $k \in Z$ we have $x_{0}=x_{1}=\ldots=x_{n-1}=0$.

Proof. We first show $x_{0}=0$. Put

$$
d:=\max \left\{\left\|A_{m} x_{j}\right\|,\left\|B^{-1} x_{j}\right\|: 1 \leq m \leq(n-1) ; 0 \leq j \leq(n-1)\right\}
$$

For the sake of simplicity, denote $\alpha:=2 k \pi i$. From (2.11) we have

$$
\begin{equation*}
\left\|\alpha^{n-1} B^{-1} x_{0}-\sum_{m=1}^{n-1} \alpha^{m-1} B_{m} x_{0}\right\|=\left\|\sum_{j=1}^{n-1}\left(\alpha^{n-j-1} B^{-1}-\sum_{m=j+1}^{n-1} \alpha^{m-j-1} B_{m}\right) x_{j}\right\| \tag{2.12}
\end{equation*}
$$

Using triangle inequality for each side of (2.12) we have

$$
\begin{align*}
\left\|\alpha^{n-1} B^{-1} x_{0}-\sum_{m=1}^{n-1} \alpha^{m-1} B_{m} x_{0}\right\| & \geq|\alpha|^{n-1}\left\|B^{-1} x_{0}\right\|-d \sum_{m=1}^{n-1}|\alpha|^{m-1} \\
& =|\alpha|^{n-1}\left\|B^{-1} x_{0}\right\|-d \frac{|\alpha|^{n-1}-1}{|\alpha|-1} \tag{2.13}
\end{align*}
$$

and

$$
\begin{align*}
\left\|\sum_{j=1}^{n-1}\left(\alpha^{n-j-1} B^{-1}-\sum_{m=j+1}^{n-1} \alpha^{m-j-1} B_{m}\right) x_{j}\right\| & \leq d \sum_{j=1}^{n-1}\left(|\alpha|^{n-j-1}+\sum_{m=j+1}^{n-1}|\alpha|^{m-j-1}\right) \\
& =d \sum_{j=1}^{n-1} \sum_{m=j+1}^{n}|\alpha|^{m-j-1} \\
& =d \sum_{j=1}^{n-1} \frac{|\alpha|^{n-j}-1}{|\alpha|-1} \\
& =d \frac{\sum_{j=1}^{n-1}|\alpha|^{n-j}-(n-1)}{|\alpha|-1} \\
& =d \frac{\left(|\alpha|^{n}-|\alpha|\right) /(|\alpha|-1)-(n-1)}{|\alpha|-1} \\
& =d \frac{|\alpha|^{n}-n|\alpha|+(n-1)}{(|\alpha|-1)^{2}} . \tag{2.14}
\end{align*}
$$

Combining (2.13) and (2.14) we obtain

$$
|\alpha|^{n-1}\left\|B^{-1} x_{0}\right\| \leq d\left(\frac{|\alpha|^{n-1}-1}{|\alpha|-1}+\frac{|\alpha|^{n}-n|\alpha|+(n-1)}{(|\alpha|-1)^{2}}\right)
$$

which implies

$$
\left\|B^{-1} x_{0}\right\| \leq d \frac{2|\alpha|^{n}-|\alpha|^{n-1}-(n+1)|\alpha|+n}{|\alpha|^{n+1}-2|\alpha|^{n}+|\alpha|^{n-1}} .
$$

Replace $\alpha=2 k \pi i$ back, we have

$$
\begin{equation*}
\left\|B^{-1} x_{0}\right\| \leq d \frac{2|2 k \pi|^{n}-|2 k \pi|^{n-1}-(n+1)|2 k \pi|+n}{|2 k \pi|^{n+1}-2|2 k \pi|^{n}+|2 k \pi|^{n-1}} \tag{2.15}
\end{equation*}
$$

for all $k \in Z$. Let $k \rightarrow \infty$, then the right hand side of (2.15) approaches to zero. Hence $B^{-1} x_{0}=0$, and thus, $x_{0}=0$. With the same manner, we can show $x_{1}=0$, and then $x_{2}=0$ and so on, and the lemma is proved.
Proof of Proposition 5. Suppose $u$ is a mild 1-periodic solution of (1.1), which is $(n-1)$ times continuously differentiable, then $u^{\prime}, u^{\prime \prime}, \ldots, u^{(n-1)}$ are also 1-periodic, i.e. $u(1)=u(0), u^{\prime}(1)=u^{\prime}(0), \ldots, u^{(n-1)}(1)=u^{(n-1)}(0)$. Hence (2.10) follows directly from (2.3). Conversely, suppose (2.10) holds for all $k \in Z$. That means

$$
\sum_{j=0}^{n-1}\left((2 k \pi i)^{n-j-1} B^{-1}-\sum_{m=j+1}^{n-1}(2 k \pi i)^{m-j-1} B_{m}\right)\left[u^{(j)}(0)-u^{(j)}(1)\right]=0
$$

for all $k \in Z$. By Lemma 6 then $u^{(j)}(0)-u^{(j)}(1)=0$ for all $j=0,1, \ldots, n-1$. In particular, $u$ is 1 -periodic function.
From Proposition 5 we obtain
Corollary 7. Suppose $f \in L_{p}(J)$. Then
(i) If $S(2 k \pi i)$ is injective for $k \in Z$, then Equation (1.1) has at most one 1-periodic mild solution, which belongs to $P^{n-1}(J)$.
(ii) If there exists a number $k \in Z$ such that $f_{k} \notin \operatorname{Range} S(2 k \pi i)$, then Equation (1.1) has no periodic mild solution which belongs to $P^{n-1}(J)$.

We now are going to find conditions such that for each function $f \in W_{p}^{m}(J)$, Equation (1.1) has a unique 1-periodic mild solution, which is $(n-1)$ times continuously differentiable. We are in the position to state the main result.

Theorem 8. Let $A_{j}, j=0,2, \ldots, n-1$, be linear, closed operators on $E$. The following statements are equivalent.
(i) For each $f \in W_{p}^{m}(J)$, Equation (1.1) admits a 1-periodic mild solution, which belong to $W_{p}^{n}(J)$ (i.e. $u \in P W^{n-1}(J)$ );
(ii) For each $k \in Z, 2 k \pi i \in \varrho(S)$ and there exists a constant $C>0$ such that

$$
\begin{equation*}
\left\|\sum_{k} S(2 k \pi i)^{-1} e^{2 k \pi i} \cdot x_{k}\right\|_{W_{p}^{n}} \leq C \cdot\left\|\sum_{k} e^{2 k \pi i} \cdot x_{k}\right\|_{W_{p}^{m}} ; \tag{2.16}
\end{equation*}
$$

for any finite sequence $\left\{x_{k}\right\} \subset E$
If $E$ is a Hilbert space, $p=2$, and $0 \leq r \leq m$, then (i) and (ii) are equivalent to
(iii) For each $f \in W_{p}^{r}(J)$, Equation (1.1) admits a 1-periodic mild solution, which belong to $W_{p}^{n-m+r}(J)$;
(iv) For every $k \in Z,(2 k \pi i) \in \varrho(S)$ and

$$
\begin{equation*}
\sup _{k \in Z}\left\|k^{n-m} S(2 k \pi i)^{-1}\right\|<\infty \tag{2.17}
\end{equation*}
$$

We will need the following lemma.
Lemma 9. Let $F_{1}:=W_{p}^{m}(J)$ and $F_{2}:=W P_{p}^{n}(J)$. Then the following are equivalent:
(1) For each function $f \in F_{1}$, (1.1) admits a unique mild solution $u$ in $F_{2}$.
(2) There exists a dense subset $D$ in $F_{1}$ such that:
(i) For each function $f \in D$, (1.1) admits a unique mild solution $u$ in $F_{2}$;
(ii) There exists a constant $C>0$ such that

$$
\begin{equation*}
\|u\|_{F_{2}} \leq C\|f\|_{F_{1}} \tag{2.18}
\end{equation*}
$$

for all $f \in D$.
Proof. (1) $\Rightarrow$ (2): Suppose for each function $f \in F_{1}$, (1.1) admits a unique mild solution $u$ in $F_{2}$. Define the operator $G: F_{1} \rightarrow F_{2}$ as follows: For each $f \in F_{1}$, $G f$ is the unique mild solution of (1.1) in $F_{2}$. By the assumptions, $G$ is everywhere defined. We will show $G$ is bounded by proving it is a closed operator.
To that end, let $\left\{f_{l}\right\}_{l>0}$ be a sequence in $F_{1}$ with $\lim _{l \rightarrow \infty} f_{l}=f$ in $F_{1}$ and $\lim _{l \rightarrow \infty} u_{l}=$ $\lim _{m \rightarrow \infty} G f_{l}=u$ in $F_{2}$. We will show $u=G f$. Note that for each $t \in[0,1]$ and $j=0,1,2, \ldots,(n-1)$ we have $\lim _{l \rightarrow \infty} u_{l}^{(j)}=u^{(j)}(t), \lim _{l \rightarrow \infty} \int_{0}^{t} u_{l}(s) d s=\int_{0}^{t} u(s) d s$ and $\lim _{l \rightarrow \infty} \int_{0}^{t} f_{l}(s) d s=\int_{0}^{t} f(s) d s$. Hence, if we denote

$$
v_{l}(t):=\sum_{j=1}^{n-1} B_{j} u_{l}^{(j-1)}(t)+B_{0} \int_{0}^{t} u_{l}(s) d s
$$

then

$$
\lim _{l \rightarrow \infty} v_{l}(t)=\sum_{j=1}^{n-1} B_{j} u^{(j-1)}(t)+B_{0} \int_{0}^{t} u(s) d s
$$

Moreover,

$$
\begin{aligned}
B v_{l}(t) & =B\left(\sum_{j=1}^{n-1} B_{j} u_{l}^{(i-1)}(t)+B_{0} \int_{0}^{t} u_{j}(s) d s\right) \\
& =u_{l}^{(n-1)}(t)-u_{l}^{(n-1)}(0)-\int_{0}^{t} f_{l}(s) d s \\
& \rightarrow u^{(n-1)}(t)-u^{(n-1)}(0)-\int_{0}^{t} f(s) d s
\end{aligned}
$$

as $l \rightarrow \infty$. Since $B$ is a closed operator, we have

$$
\sum_{j=1}^{n-1} B_{j} u^{(j-1)}(t)+B_{0} \int_{0}^{t} u(s) d s \in D(B)
$$

and

$$
B\left(\sum_{j=1}^{n-1} B_{j} u^{(j-1)}(t)+B_{0} \int_{0}^{t} u(s) d s\right)=u^{(n-1)}(t)-u^{(n-1)}(0)-\int_{0}^{t} f(s) d s
$$

which means that $u$ is a mild solution of (1.1) corresponding to $f$. So, $G$ is a bounded operator and (2) is satisfied with $C=\|G\|$.
Conversely, suppose (2) is satisfied. Then, for any $f \in F_{1}$ there exists a sequence $\left\{f_{l}\right\} \subset D$ such that $f_{l} \rightarrow f$ in $F_{1}$ topology as $l \rightarrow \infty$. Let $u_{l}$ be the mild solution to (1.1) in $F_{2}$ corresponding to $f_{l}$, then, by (2.18), $\lim _{l \rightarrow \infty} u_{l}=u$ for some $u \in F_{2}$ in $F_{2}$ topology and $\|u\|_{F_{2}} \leq C\|f\|_{F_{1}}$. With the same manner as the above part, we can show that $u$ is a mild solution corresponding to $f$. The uniqueness of $u$ can be easily clarified by using (2.18) and the lemma is proved.
Proof of Theorem 8. First we prove the following note: If $x_{0}$ and $f_{0}$ are two vectors in $E$ with $S(2 k \pi i) x_{0}=f_{0}$, then $u(t):=e^{2 k \pi i t} x_{0}$ is a (classical) solution to (1.1) corresponding to $f(t):=e^{2 k \pi i t} f_{0}$. Indeed, $S(2 k \pi i) x_{0}=f_{0}$ means

$$
\sum_{j=0}^{n-1}(2 k \pi i)^{j} B_{j} x_{0} \in D(B)
$$

and

$$
\begin{equation*}
(2 k \pi i)^{n} x_{0}-B \sum_{j=0}^{n-1}(2 k \pi i)^{j} B_{j} x_{0}=f_{0} \tag{2.19}
\end{equation*}
$$

Multiply both side of (2.19) by $e^{2 k \pi i t}$ and note that $u^{(j)}(t)=(2 k \pi i)^{j} e^{2 k \pi i t} x_{0}$, we have

$$
u^{(n)}(t)-B \sum_{j=0}^{n-1} B_{j} u^{(j)}(t)=f(t),
$$

which means $u$ is a classical solution to (1.1).
(i) $\rightarrow$ (ii): We first show that $2 k \pi i \in \varrho(S)$ for each $k \in Z$. To that end, suppose $x$ is any vector in $E, f(t)=e^{2 k \pi i t} x$ and let $u(t)$ be the unique mild 1-periodic solution to (1.1) corresponding to $f$, which is in $W_{p}^{n}(J)$. By Proposition 5 we have $S(2 k \pi i) u_{k}=x$. Hence $S(2 k \pi i)$ is surjective. On the other side, if $S(2 k \pi i)$ is not invertible, i.e. there is a non-zero vector $x_{0} \in E$ such that $S(2 k \pi i) x_{0}=0$, then, by the above note, $u_{1}(t): \equiv 0$ and $u_{2}(t):=e^{2 k \pi i t} x_{0}$ are two distinct 1-periodic classical, and hence mild solutions to the homogeneous equation $u^{(n)}(t)=\sum_{j=0}^{n-1} A_{j} u^{(j)}(t)$. This is contradicting to the uniqueness of $u$. So $S(2 k \pi i)$ is invertible, i.e. $2 k \pi i \in \varrho(S)$.
Let now $f(t):=\sum_{k} e^{2 k \pi i t} x_{k}$, where $\left\{x_{k}\right\}$ is any finite sequence in $E$. Then, by Proposition $5, u(t)=\sum_{k}\left(S(2 k \pi i)^{-1} e^{2 k \pi i t} x_{k}\right.$ is the unique 1-periodic classical solution to (1.1) corresponding to $f$. Thus, (2.16) is obtained by inequality $\|u\|_{W_{p}^{n}} \leq$ $\|G\| \cdot\|f\|_{W_{p}^{m}}$.
(ii) $\rightarrow$ (i): Put

$$
\mathcal{M}:=\left\{f(t)=\sum_{k} e^{2 k \pi i t} x_{k}:\left\{x_{k}\right\} \text { is a finite sequence in } E\right\} .
$$

Observe that $\mathcal{M}$ is dense in $W_{p}^{m}(J)$. Moreover, if $f$ is a function in $\mathcal{M}$, i.e., if $f(t)=\sum_{k} e^{2 k \pi t} x_{k}$, then $u(t)=\sum_{k}(S(2 k \pi i))^{-1} e^{2 k \pi i t} x_{k}$ is a 1-periodic classical solution of (1.1) corresponding to $f$ and, by Corollary $7(i)$, it is the unique one. From (2.16) it follows that $\|u\|_{W_{p}^{n}(J)} \leq C\|f\|_{W_{p}^{m}(J)}$ for all $f \in \mathcal{M}$. By Lemma 9, that implies (i).
If $E$ now is a Hilbert space, then $W_{2}^{m}(J)$ is a Hilbert space for any $0 \leq m \leq n$ with the norm

$$
\|f\|_{W_{2}^{m}}^{2}=\sum_{j=0}^{m}\left\|f^{(j)}\right\|^{2}
$$

We first prove the equivalence $(i i) \Leftrightarrow(i v)$. Suppose (ii) holds. For any $k \in Z$, take $f(t):=e^{2 k \pi i t} x$ and $u(t)=S(2 k \pi i)^{-1} e^{2 k \pi i t} x$ be the corresponding solution to (1.1). We have

$$
\begin{equation*}
\|f\|_{W_{2}^{m}(J)}^{2}=\sum_{j=0}^{m}\left\|(2 k \pi)^{j} x\right\|^{2} \tag{2.20}
\end{equation*}
$$

and

$$
\|u\|_{W_{2}^{n}(J)}^{2}=\sum_{j=0}^{n}\left\|(2 k \pi)^{j} S(2 k \pi i)^{-1} x\right\|^{2} .
$$

Using (2.16) we have

$$
\sum_{j=0}^{n}\left\|(2 k \pi)^{j} S(2 k \pi i)^{-1} x\right\|^{2} \leq C^{2} \sum_{j=0}^{m}\left\|(2 k \pi)^{j} x\right\|^{2},
$$

which implies

$$
\begin{equation*}
\left\|S(2 k \pi i)^{-1} x\right\|^{2} \leq C^{2} \frac{\sum_{j=0}^{m}|2 k \pi|^{2 j}}{\sum_{j=0}^{n}|2 k \pi|^{2 j}} \cdot\|x\|^{2} \tag{2.21}
\end{equation*}
$$

for any $x \in E$ and any $k \in Z$.
For a positive number $\lambda$ and an integer $m$ with $0 \leq m \leq n$ it is easy to show the inequality:

$$
\frac{\sum_{j=0}^{m} \lambda^{2 j}}{\sum_{j=0}^{n} \lambda^{2 j}} \leq \frac{1}{\lambda^{2(n-m)}}
$$

Thus, from (2.21) we have

$$
\left\|S(2 k \pi i)^{-1} x\right\| \leq C \frac{1}{|2 k \pi|^{n-m}} \cdot\|x\|
$$

for all $k \in Z$ and all $x \in E$, from which (2.17) follows.

Conversely, suppose ( $i v$ ) holds, i.e., there is a constant $C>0$ such that $\left\|S(2 k \pi i)^{-1}\right\| \leq$ $C|k|^{m-n}$ for $k \in Z$. Using that inequality we have

$$
\begin{aligned}
\| \sum_{k}\left(S(2 k \pi i)^{-1} e^{2 k \pi i} \cdot x_{k} \|_{W_{2}^{n}(J)}^{2}\right. & =\sum_{j=0}^{n}\left(\sum_{k}(2 k \pi)^{2 j}\left\|S(2 k \pi i)^{-1} x_{k}\right\|^{2}\right) \\
& \leq C \sum_{j=0}^{n}\left(\sum_{k}(2 k \pi)^{2 j} k^{2 m-2 n}\left\|x_{k}\right\|^{2}\right) \\
& \leq C_{1} \sum_{j=0}^{n}\left(\sum_{k}(2 k \pi)^{2 j+2 m-2 n}\left\|x_{k}\right\|^{2}\right) \\
& =C_{1} \sum_{k}\left(\sum_{j=0}^{n}(2 k \pi)^{2 j+2 m-2 n}\right)\left\|x_{k}\right\|^{2} \\
& \leq C_{1}(n+1) \sum_{k}(2 k \pi)^{2 m}\left\|x_{k}\right\|^{2} \\
& \leq C_{1}(n+1) \sum_{j=0}^{m}\left(\sum_{k}(2 k \pi)^{2 j}\left\|x_{k}\right\|^{2}\right) \\
& =C_{1}(n+1)\left\|\sum_{k} e^{2 k \pi i} x_{k}\right\|_{W_{2}^{m}(J)}^{2},
\end{aligned}
$$

where $C_{1}=C(2 \pi)^{n-m}$. Thus, (2.16) holds and (ii) is satisfied.
Finally, observe that if $E$ is a Hilbert space and $0 \leq r \leq m$, then with the same manner as in the proof $(i i) \Leftrightarrow(i v)$, we can show that $(i v)$ is equivalent to
$\left(i i^{\prime}\right)$ For each $k \in Z, 2 k \pi i \in \varrho(S)$ and there exists a constant $C>0$ such that

$$
\begin{equation*}
\left\|\sum_{k}\left(S(2 k \pi i)^{-1} e^{2 k \pi i} \cdot x_{k}\right)\right\|_{W_{p}^{n-m+r}} \leq C \cdot\left\|\sum_{k} e^{2 k \pi i \cdot} x_{k}\right\|_{W_{p}^{r}} \tag{2.22}
\end{equation*}
$$

for any finite sequence $\left\{x_{k}\right\} \subset E$.
On the other hand, $\left(i i^{\prime}\right)$ is equivalent to (iii) due to Lemma 9. Hence, (iii) is equivalent to (iv) and the theorem is completely proved.

## 3 Some special cases

The $u^{(n)}(t)=A u(t)+f(t)$ case: We consider the higher order differential equation

$$
\begin{equation*}
u^{(n)}(t)=A u(t)+f(t), \quad 0 \leq t \leq 1 \tag{3.1}
\end{equation*}
$$

where $A$ is a linear, closed and densely defined operator with $\varrho(A) \neq \emptyset$. In this case, Condition F is satisfied, as we choose $B=(\lambda-A)$, where $\lambda \in \varrho(A)$. Indeed,
$\overline{B^{-1} A}=\overline{(\lambda-A)^{-1} A}=\lambda(\lambda-A)^{-1}-\lambda I$ is bounded. Also, $S(\lambda)=\left(\lambda^{n}-A\right)$. Hence, applying Theorem 8, we have

Theorem 10. The following statements are equivalent.
(i) For each function $f \in W_{p}^{m}$, Equation (3.1) admits a unique 1 periodic mild solution in $W_{p}^{n}$;
(ii) For each $k \in Z,(2 k \pi i)^{n} \in \varrho(A)$ and there exists a constant $C>0$ such that

$$
\begin{equation*}
\left\|\sum_{k}\left((2 k \pi i)^{n}-A\right)^{-1} e^{2 k \pi i} \cdot x_{k}\right\|_{P W_{p}^{n-1}} \leq C \cdot\left\|\sum_{k} e^{2 k \pi i} \cdot x_{k}\right\|_{W_{p}^{m}} \tag{3.2}
\end{equation*}
$$

for any finite sequence $\left\{x_{k}\right\} \subset E$
If $E$ is a Hilbert space, $p=2$ and $0 \leq r \leq m$, then (i) and (ii) are equivalent to
(iii) For each function $f \in W_{p}^{r}$, Equation (3.1) admits a unique 1-periodic mild solution in $W_{p}^{n-m+r}$;
(iv) For every $k \in Z,(2 k \pi i)^{n} \in \varrho(A)$ and

$$
\begin{equation*}
\sup _{k \in Z}\left\|k^{n-m}\left((2 k \pi i)^{n}-A\right)^{-1}\right\|<\infty \tag{3.3}
\end{equation*}
$$

The Semigroup case: When $n=1$ and $A$ generates a $C_{0}$-semigroup $(T(t))_{t \geq 0}$, then the mild solution of the differential equation

$$
\begin{equation*}
u^{\prime}(t)=A u(t)+f(t), \quad 0 \leq t \leq 1 \tag{3.4}
\end{equation*}
$$

can be expressed by

$$
\begin{equation*}
u(t)=T(t) u(0)+\int_{0}^{t} T(t-s) f(s) d s \tag{3.5}
\end{equation*}
$$

We have the following result, in which the equivalence between $(i)$ and $(v)$ is the Gearhart's Theorem [6].

Theorem 11. Let $A$ generate a $C_{0}$-semigroup $(T(t))_{t \geq 0}$. Then the following statements are equivalent:
(i) $1 \in \varrho(T(1))$;
(ii) For every function $f \in L_{p}(J)$, Equation (3.4) admits a unique 1-periodic mild solution;
(iii) For every function $f \in W P_{p}^{1}(J)$, Equation (3.4) admits a unique mild solution in $W P_{p}^{1}(J)$;
(iv) For every function $f \in W P_{p}^{1}(J)$, Equation (3.4) admits a unique 1-periodic classical solution

If $E$ is a Hilbert space, all the above statements are equivalent to
(v) $\{2 k \pi i: k \in Z\} \subset \varrho(A)$ and

$$
\sup _{k \in Z}\left\|(2 k \pi i-A)^{-1}\right\|<\infty
$$

Proof. The equivalence (i) $\Leftrightarrow$ (ii) was proved in [14]. The equivalence (ii) $\Leftrightarrow$ (iv) can be shown by using standard arguments and, if $E$ is a Hilbert space, (iii) $\Leftrightarrow$ (v) follows from Theorem 10. The inclusion $(i v) \Rightarrow(i i i)$ is obvious. So, it remains to show (iii) $\rightarrow$ (iv).
To this end, let $u$ be the unique mild solution of (3.4), which belong to $W P_{p}^{1}(J)$. Since $\int_{0}^{t} T(t-s) f(s) d s \in D(A)$ and $t \rightarrow \int_{0}^{t} T(t-s) f(s) d s$ is continuously differentiable for any $f \in W_{p}^{1}(J)$ (see e.g. [11]), we obtain that $T(\cdot) u(0) \in W_{p}^{1}(J)$. It follows that $T(t) u(0) \in D(A)$ for $t>0$ (since $t \mapsto T(t) x$ is differentiable at $t_{0}$ if and only if $\left.T\left(t_{0}\right) x \in D(A)\right)$. Hence, $u(1)$, and thus, $x=u(1)$ belongs to $D(A)$. So $u$ is a classical solution. The uniqueness of the 1-periodic classical solution is obvious.

A cosine family case: We now consider the second order differential equation:

$$
\begin{equation*}
u^{\prime \prime}(t)=A u(t)+f(t) \quad 0 \leq t \leq 1 \tag{3.6}
\end{equation*}
$$

where $A$ is generator of a cosine family $(C(t))_{t \in R}$ on $E$. Recall (see u.g. [1]) that in this case there exists a Banach space $F$ such that $D(A) \hookrightarrow F \hookrightarrow E$ and such that the operator

$$
\mathcal{A}:=\left(\begin{array}{ll}
0 & I \\
A & 0
\end{array}\right)
$$

with $D(\mathcal{A})=D(A) \times F$ generates the $C_{0}$-semigroup $\mathcal{T}(t):=\left(\begin{array}{cc}C(t) & S(t) \\ C^{\prime}(t) & C(t)\end{array}\right)$ on $F \times E$, where $S(t)$ is the associated sine family. Moreover, it is not hard to check that $u$ is a mild solution of (3.6), which is continuously differentiable (a mild solution, which is in $W P_{p}^{2}(J)$, or a classical solution of (3.6), respectively), if and only if $\mathcal{U}=\left(u, u^{\prime}\right)^{T}$ is a mild solution (a mild solution, which is in $W P_{p}^{1}(J)$, or a classical solution, respectively) of the first order differential equation

$$
\begin{equation*}
\mathcal{U}^{\prime}(t)=\mathcal{A U}(t)+(0, f(t))^{T}, \quad 0 \leq t \leq 1 \tag{3.7}
\end{equation*}
$$

in space $F \times E$. Using (3.5), we have the explicit form of $u$ by

$$
u(t)=C(t) u(0)+S(t) u^{\prime}(0)+\int_{0}^{t} S(s-\tau) f(\tau) d \tau
$$

We have the following result, in which the equivalence between (i) and (ii) is proved in $[17]$ and the equivalence among $(i i),(i i i),(i v)$ and $(v)$ follows from the above observation and Theorem 11.

Theorem 12. Let $A$ generate a cosine family $(C(t))_{t \in R}$ in $E$. Then the following statements are equivalent.
(i) $1 \in \varrho(C(1))$;
(ii) For each function $f \in L_{p}(J)$, Equation (3.6) has a unique 1-periodic mild solution, which is continuously differentiable;
(iii) For each function $f \in W P_{p}^{1}(J)$, Equation (3.6) admits a unique mild solution in $W P_{p}^{2}(J)$;
(iv) For each function $f \in W P_{p}^{1}(J)$, Equation (3.6) admits a unique 1-periodic classical solution;

If $E$ is a Hilbert space, all the above statements are equivalent to
(v) $\left\{-4 k^{2} \pi^{2}: k \in Z\right\} \subset \varrho(A)$ and

$$
\sup _{k \in Z}\left\|k\left(4 k^{2} \pi^{2}+A\right)^{-1}\right\|<\infty
$$

A complete case: We consider the following differential equation:

$$
\begin{equation*}
\prod_{j=1}^{n}\left(\frac{d}{d t}-a_{j} A\right) u(t)=f(t), \quad 0 \leq t \leq 1 \tag{3.8}
\end{equation*}
$$

where $a_{j}, j=1,2, \ldots, n$ are non-zero complex numbers and $A$ is a linear and closed operator on $E$ with $\varrho(A) \neq \emptyset$. We can re-write (3.8) as the following:

$$
\begin{equation*}
u^{(n)}(t)+\sum_{j=0}^{n-1} b_{j} A^{n-j} u^{(j)}(t)=f(t) \tag{3.9}
\end{equation*}
$$

where $b_{j}$ are certain, corresponding coefficients. So, in this case $A_{j}=-b_{j} A^{n-j}$ and they satisfy Condition F with $B=(\lambda-A)^{n}$. Moreover, by a short calculation, $S(\lambda)$ is

$$
\begin{aligned}
S(\lambda) & =\lambda^{n}+\sum_{j=0}^{n-1} \lambda^{j} b_{j} A^{n-j} \\
& =\prod_{j=1}^{n}\left(\lambda-a_{j} A\right)
\end{aligned}
$$

with $D(S(\lambda))=D\left(A^{n}\right)$. It is not hard to show that $\lambda \in \varrho(S)$ if and only if $\lambda / a_{j} \in$ $\varrho(A)$ and

$$
S(\lambda)^{-1}=\prod_{j=1}^{n}\left(\lambda-a_{n-j+1} A\right)^{-1}=\prod_{j=1}^{n}\left(\lambda-a_{j} A\right)^{-1}
$$

Hence, from Theorem 8 we have:
Theorem 13. Let $A$ be a linear and closed operator on a Hilbert space $E$ with $\varrho(A) \neq \emptyset$ and $0 \leq m \leq r \leq n$. Then, for each function $f \in W_{2}^{m}$, Equation (3.8) admits a unique 1-periodic mild solution in $W_{2}^{r}(J)$, if for all $k \in Z$, the following conditions are satisfied:
(i) $\frac{2 k \pi i}{a_{j}} \in \varrho(A)$ for $j=1,2, \ldots, n$;
(ii) There exists a constant $C$ such that $|k|^{(r-m) / n}\left\|\left(2 k \pi i-a_{j} A\right)^{-1}\right\|<C$.
